Новый взгляд на влияние искусственного интеллекта на рабочие места

Ramp – Revelio: расходы компаний на ИИ и корректировка рабочей силы

Аннотация

Мы изучаем, как меняется занятость в компаниях, внедряющих генеративный искусственный интеллект, на основе данных о расходах на ИИ, полученных с помощью карты Ramp и данных об оплате счетов, связанных с кадровыми данными Revelio Labs для 21 559 компаний в США. Мы обнаружили, что компании, внедряющие ИИ, после внедрения, как правило, растут быстрее, но эта закономерность характерна почти исключительно для компаний, внедряющих ИИ с высокой интенсивностью. В компаниях, вкладывающих больше всего средств в ИИ, после внедрения численность персонала увеличивается примерно на 10%, в то время как в компаниях с низкой интенсивностью внедрения статистически значимых изменений не наблюдается. Штат сотрудников начального уровня в компаниях, активно внедряющих ИИ, увеличивается на 12 %. Выгода проявляется постепенно и распространяется на все должности, включая инженерное дело, продажи, администрирование и работу с клиентами. Выгода также распределяется неравномерно: внедряющие ИИ компании уже являются более крупными, технически продвинутыми и быстрорастущими, а отраслевая выгода сосредоточена в сфере информационных технологий. Эти результаты противоречат прогнозам о том, что внедрение ИИ приведет к массовой потере рабочих мест.

Основные выводы

Фирмы, внедрившие ИИ, увеличили штат сотрудников на 10,2% за два года после внедрения, но этот рост полностью обусловлен внедрением ИИ в компаниях с высокой интенсивностью внедрения. В компаниях с низкой интенсивностью внедрения статистически значимых изменений не наблюдается.

Штат сотрудников начального уровня рос еще быстрее. В компаниях, которые вкладывают больше всего средств в ИИ, штат сотрудников начального уровня за два года после внедрения ИИ вырос на 12%.

Внедрение ИИ и связанные с ним выгоды распределяются неравномерно. Компании, внедрившие ИИ, уже крупнее, в них больше инженеров, они чаще получают венчурные инвестиции и растут быстрее, чем компании, которые не внедряли ИИ. После внедрения ИИ эти компании растут еще быстрее.

Source: Kharazian, A., Simon, L., & Stevens, R. (2026). A New Look at AI's Impact on Jobs: Firm-Level AI Spending and Workforce Adjustment. Ramp Economics Lab. https://ramp.com/data/ai-jobs-impact

Methodology

We link firm-level Ramp transaction data to Revelio Labs workforce records to study employment changes following paid generative AI adoption. Ramp card and bill pay records identify monthly AI vendor spend, including foundation models, GPU cloud, model serving, coding agents, API tools, and AI image, video, search, and research products. Revelio provides monthly firm-level headcount and workforce composition. The linked panel covers 21,559 U.S. firms observed monthly from January 2021 through February 2026.

We define AI adoption as the first month of the earliest three-consecutive-month spell in which a firm records at least $100 of AI vendor spend in every month. This rule screens out one-off experiments and captures sustained organizational use. Among treated firms, adoption intensity is measured as AI spend per baseline employee over the first three post-adoption months, using headcount in the month before adoption as the denominator. High-intensity adopters are firms in the top tercile of this measure; lower-intensity adopters are firms in the bottom two terciles.

Our preferred design is a Callaway-Sant'Anna staggered difference-in-differences estimator. Because permanent non-adopters differ sharply from adopters before treatment, the main comparison is not adopter versus never-adopter. Instead, each adopter is compared to firms in the same eventual intensity group that adopt later but have not yet adopted in that calendar month. Specifications include NAICS sector fixed effects, estimate dynamic effects from 12 months before adoption through 24 months after adoption, and use pre-adoption event-study coefficients as the main diagnostic for parallel trends.

Frequently asked questions

How do you measure which firms adopt AI?

We identify AI adoption from Ramp card and bill pay transactions to AI vendors, including OpenAI and Anthropic and other AI infrastructure companies and software firms. A firm is classified as adopting AI in the first month of its earliest three-consecutive-month spell with at least $100 of AI vendor spend in each month. High-intensity adopters generally spend much more. This screens out one-off purchases and captures sustained paid AI use.

What do "high" and "low" AI intensity mean?

Among adopters, intensity is measured as AI spend per baseline employee over the first three months after adoption begins. Baseline headcount is measured in the month before adoption. High-intensity adopters are firms in the top tercile of this measure; lower-intensity adopters are firms in the bottom two terciles. In the estimating sample, lower-intensity adopters average about $2.78 per employee per month in the first 3 months of adoption, while high-intensity adopters average about $33.67. In both groups, per employee per month spend rises as firms advance along the adoption curve.

What is the control group?

The preferred comparison group is not-yet-treated firms: companies in the same eventual AI-intensity group that adopt AI later but have not yet adopted in a given event month. The specification also includes NAICS sector fixed effects. As a robustness check, comparing adopters to never-adopters still shows larger employment gains, about 12.6%

for high-intensity adopters; however, the non-adopter control group is less reliable. Adopters were already growing headcount faster than non-adopters pre-adoption.

Does this mean AI is not replacing any jobs?

Our firm-level results show no broad job loss — high-intensity adopters grew headcount, including entry-level roles. We cannot rule out reallocation within firms over a longer horizon; the 24-month window may be too early to detect large changes in workforce mix. We plan to update our results regularly to track firms beyond the first 24 months of adoption.

Is the sample representative of all U.S. businesses?

No. The sample consists of firms using Ramp that can be linked to Revelio Labs workforce records and meet the paper's activity filters. It likely skews toward tech-forward firms and workers in knowledge-work. It is best interpreted as evidence from a selected, business-spend-active firm population, not a nationally representative sample of all U.S. businesses. In any case, we also report results sector-by-sector.
