«Агент — это большая языковая модель и платформа»: что на самом деле думает Nvidia об OpenClaw

Надер Халил из Nvidia о поддержке OpenClaw, создании прототипов агентов и о том, почему каждое предприятие вскоре будет выпускать собственных специализированных агентов с искусственным интеллектом.

В какой степени деятельность Nvidia отражает взгляды ее дальновидного генерального директора Дженсона Хуана? Похвалив, а затем и поддержав OpenClaw, Хуан сделал большой шаг за пределы корпоративной сферы, чтобы принять «плохого парня» из мира агентов. Какое место в этой истории занимает Nvidia?

The New Stack задал этот вопрос **Надеру Халилу**, директору по технологиям разработчиков в Nvidia, а также узнал, как Nvidia сотрудничает с разработчиками в проектах по созданию агентного ИИ.

Nvidia. Его компания помогала стартапам получать доступ к наборам микросхем Nvidia для искусственного интеллекта. Халил по-прежнему воодушевлен возможностями искусственного интеллекта, и его энтузиазм доказывает, что Nvidia наслаждается моментом. Халил был очень эмоционален, демонстрируя присущую стартапам способность быстро реагировать на происходящие вокруг изменения.

Надер Халил, директор по технологиям для разработчиков в Nvidia

Прежде всего Халил дает определение тому, что, по его мнению, представляет собой агент. «У меня есть несколько слайдов», — угрожает он. Но это скорее попытка систематизировать свои мысли по часто задаваемому вопросу, а не нравоучения.

«Агент — это большая языковая модель и система управления... Каждая итерация должна приближать нас к нашей цели».

«Агент — это большая языковая модель и система управления. Если вдуматься, то это две вещи. Это цикл и большая языковая модель. Очевидно, что вы не хотите, чтобы каждый цикл выполнял одну и ту же задачу. Вам нужно использовать результаты работы большой языковой модели. Это может включать в себя поиск новых инструментов. Каждый цикл должен приближать нас к нашей цели».

Надер высоко оценивает раннюю инициативу OpenAI. «ChatGPT привнес инновации, выходящие за рамки модели. Это была не просто отличная модель, они также добавили подсказки. Была системная подсказка, а была пользовательская; была мультимодальная подсказка, и внезапно я понял, что это отличный способ использовать большую языковую модель. Каждый пользователь мог воспользоваться системной подсказкой, написанной OpenAI, в то время как вы использовали свою индивидуальную подсказку».

Халил продолжает: «Затем они добавили память».

remembers what my smoker is, recalls Khalil. The thing that I was missing was files.”

Of course, the story continues through Cursor to Claude. “But this is the harness. Everything here is the harness,” he says.

Khalil moves on to how Nvidia works today. “The way to get your product into this rapidly growing market is with skills. Hence the CUDA X library.”

“And so we look at every product we build now, it needs to have a skill because you need to cater to this growing audience,” he says.

This is how Nvidia first works with in-house experts, and connects to their edge hardware.

Supporting OpenClaw

Khalil was happy with the wording that Nvidia are “supporting” OpenClaw. “We’re just squarely in the community”, agrees Khalil. “We do this by the way, through a lot of projects that are very important in the open source ecosystem.”

But OpenClaw is not just any project and could be considered quite a risk to associate with. “We have a couple of developers at the company that contribute to OpenClaw full time.” Pushed on the nature of the relationship a little more, Khalil offers, “I think we just try to contribute wherever we can. I think what’s very clear is that harnesses had a moment, right?”

“We have a couple of developers at the company that contribute to OpenClaw full time.”

It has been quite a moment. “There is a lot of change happening right now, and we’re really thankful to [Peter Steinberger], OpenClaw, and the community for creating this moment around agents and harnesses. We of course want to contribute.”

Related to this, the OpenClaw project currently has many unresolved pull requests (PRs). In fact, there were rumors that new PRs are no longer accepted at all.

“We saw Peter tweeting about some of the issues they had, and we just rolled up our sleeves and were eager to help. They bless us by allowing our contributions.”

our contributions.

Khalil reflects on things a little more: “You know the cardinal rule of code. It is easier to write than it is to read.”

And at over 800,000 lines of code, this must be true. Khalil continues, “It is easier not to have to process this complicated codebase, but every successful project right now has the same issue. It is easier to enlist many agents to help write code and build these PRs. The bottleneck is in merging the PRs through.” As well as dealing with the fallacies.

“OpenClaw was a major change for the industry. It was a huge moment, and everyone’s eyes are on it. It got more stars than Linux in months. Developers care deeply about the project because it was influential, and so I think you’re gonna see a mountain of PRs, right?”

“It got more stars than Linux in months... so I think you’re gonna see a mountain of PRs, right?”

Their attitude to OpenClaw is clearly to accept its problems, like that raucous friend who seems to wind up in police custody after a wild party, but is good at heart.

Blueprints and microwaves

Hermes is one of the newer projects in the wake of OpenClaw (like **NanoClaw**) that wants to bottle the lightning but in a safer way. Nvidia is also embracing it, but Khalil backs up to explain how Nvidia looks at projects in general.

“So, NemoClaw is our blueprint. When we see amazing harnesses, we try to figure out how we can help enterprises adopt them. Consumers sometimes want the security to run any agent; then there’s the model and harness. Then there are the skills, right. You have to give it access to your terminal.’

The term “blueprint” takes on a bit more formality in Nvidia, meaning the structure of building AI agents and systems. And of course Khalil needs to show these things working with the Nemotron model and other Nvidia solutions.

Working with agents in the enterprise is seen as a significant risk. “There are a bunch of camps,” says Khalil. “There are teams within enterprises who are more worried. We have a project called OpenShell that is our security runtime and we’ll work with.”

“Our goal is to create the tooling that’s needed in the ecosystem. Developers in industry and enterprises have actually been adopting agents. And we have been building for this audience. One way to do so is to build a specialized agent or a sub-agent. “

So Nvidia doesn’t offer a big takeover solution, but fits in with where teams already are.

Your microwave, your agent

“The way to think about it is like when you use a microwave that you haven’t used before, you have to press a lot of buttons or spend time figuring it out. But when it’s your microwave at home, you just go ‘Boop, boop. Done.’ Right?”

“So every industry in enterprise will be building these specialized agents, and many already have. Nvidia is already working with CrowdStrike and Cadence, Palantir, among many others.”

The future will be agents

Khalil believes a lot of the concern over long-running agents is slowly petering out. Which leads to the final question: is Nvidia looking to stay in the open sea where there may be dragons, or become a calm port for developers to work in?

“So our approach is: Who can we help and how?” Khalil shows no fear, or lack of sea legs. “The inflection point happened months ago, so we ask what can we do to usher in all of this technology.” Here, Khalil ties his — and, to a degree, Nvidia’s — future to green-field developers.

“There are gonna be some people quick to adapt. And some people that aren’t; and what we’re noticing, if you look at the adoption curve, many people have yet to experience this. So there’s much work in helping make sure that we deliver this early.”
