

ПЕРВАЯ В МИРЕ АГЕНТНАЯ КЛАВИАТУРА

Что такое агентная клавиатура?

Агентная клавиатура — это мобильная клавиатура с невидимым ИИ-агентом в каждом текстовом поле. Она не просто генерирует слова — **она выполняет действия от вашего имени**, прямо там, где вы печатаете, не покидая приложение.

Введите название места. Асті подбирает его и добавляет в сообщение ссылку на интерактивную карту — [без переключения между приложениями](#).

Агентная клавиатура

существительное · /eɪdʒən.tɪk/

Мобильная клавиатура с **агентом** на основе искусственного интеллекта, встроенным в каждое текстовое поле. В то время как обычная клавиатура преобразует нажатия клавиш в текст, агентная клавиатура преобразует **интент в действие** — поиск ссылки, составление ответа, создание собрания или запуск рабочего процесса — и выполняет его в любом приложении, без необходимости переключаться между ними.

Название говорит само за себя: в основе лежит искусственный интеллект *агент* — программное обеспечение, которое не просто отвечает на вопрос, но и выполняет действия, необходимые для решения задачи. Поместите его в клавиатуру, и каждое текстовое поле превратится в инструмент для выполнения задач.

На протяжении большей части истории вычислительной техники у клавиатуры была одна задача: преобразовывать нажатия клавиш в текст. Все улучшения — автозаполнение, свайповый ввод, голосовая диктовка — были просто более быстрыми способами делать то же самое. **Агентная клавиатура** ломает этот шаблон: она считывает не только *то, что вы набрали*, но и *то, что вы пытаетесь сделать*, а затем выполняет это действие. В результате получается не просто более чистое предложение, а завершённое действие: найдена ссылка, загружен документ, создана встреча, отправлен ответ.

Клавиатура перестает быть инструментом, в который вы **вводите текст**, и становится помощником, который **действует за вас** — в каждом текстовом поле вашего телефона.

02 — ГРАНИЦА КАТЕГОРИЙ

Традиционная, голосовая, с искусственным интеллектом, агентная — четыре типа клавиатур.

Измерение	Традиционная	Голосовая	С искусственным интеллектом	Агентная
Основная роль	Ввод текста	Говорить вместо печатать	Улучшение текста	Выполнение действий
Основная ценность	Печатание	Ввод без помощи рук	Помощь при написании	Выполнение намерений

Типичный результат	Символы	Транскрибированный текст	Улучшенные предложения	Ссылки, ответы, резюме, рабочие процессы, навыки
Поведение пользователя	Ввод вручную	Диктовка вслух	Запросить у ИИ переписать	Выполнение действий из контекста
Поверхность	Текстовое поле	Текстовое поле	Текстовое поле	Любое текстовое поле в качестве слоя действий
Расширяемость	Фиксированные клавиши	Фиксированная диктовка	Возможности ИИ	Пользовательские навыки

Проще говоря: традиционная клавиатура помогает печатать. Голосовая клавиатура позволяет диктовать текст. Клавиатура с искусственным интеллектом помогает писать лучше. Агентная клавиатура помогает вам **действовать**.

03 — КАК ЭТО РАБОТАЕТ

Набрать текст. Удерживать. Предварительный просмотр. Применить.

Агентная клавиатура есть в каждом приложении — в мессенджерах, электронной почте, заметках, социальных сетях, везде, где есть текстовое поле. Весь процесс настолько прост, что становится рефлексивным, и вы всегда видите результат до того, как что-то произойдет.

1 Type what you need

In plain language, in whatever app you're already in — no special syntax, no command line. Type it, or speak it; the input doesn't matter.

2 Hold the Acti Bar

Press to type, hold to act. A hold passes your request to the agent, which reads not just your words but the intent behind them — what you actually want to happen.

3 Preview the result

The agent does the work and shows you a ready-to-use result — a link, a reply, a summary, a meeting — right there in the keyboard. Nothing is sent or changed yet.

keyboard only acts when you say so.

04 — PRODUCT MECHANICS

How Acti works as an Agentic Keyboard

Acti brings actions into the keyboard through Acti Bar, Skill Keys, and custom skills. It turns every text field into an action surface.

01

Acti Bar

Understands intent and suggests useful actions, directly from the keyboard.

02

Skill Keys

Hold or tap a key to trigger a specific skill, such as creating a meeting link or generating a reply.

03

Custom Skills

Build or install skills that match your personal workflows.

05 — USE CASES

What can an Agentic Keyboard do?

M

Create a meeting link

Create a Google Meet link directly from your keyboard and send it in one tap.

Write better replies

Generate replies that match the conversation, tone, and context without leaving the app.

S

Summarize text

Turn long messages, notes, or articles into quick summaries from any text field.

T

Translate while typing

Translate messages as you type across apps and conversations.

P

Send maps

Create and send map links without opening another app.

K

Run custom skills

Trigger custom actions and workflows directly from your keyboard.

06 — SKILL BUILDER

Build your own Skills — in plain language.

These actions aren't features Acti hard-coded. Each one is a **Skill** — and anyone can build one in plain language through Acti's **Skill Builder**, with no coding required, then keep it private or publish it to the **Skill Hub** for others to add to their own keyboards.

no code, no config.

SKILL HUB

Keep it, or share it

Keep a Skill private, or publish it to the Skill Hub marketplace for anyone to add to their own keyboard in a single tap.

1,000+

Skills already built by early adopters — and the library grows every day.

Apple's and Google's keyboards are closed systems only their makers can change. Acti is the **first to make the keyboard an open, programmable platform.**

07 — CONNECTIONS

Connected to everything you already use.

An agent is only as useful as what it can reach. Acti connects two ways — link your own accounts with secure OAuth (Gmail, Slack, Notion, your calendar and more), or tap a library of **150+ APIs** you can build with, no setup required. Either way the action runs right inside your keyboard — nothing to open, nothing to copy-paste.

150+

APIS

& more

And because actions are built in plain language, any service with an API can become a new key — no code, and no waiting for an official integration.

08 — COMPARISON

Acti vs Gboard, Grammarly & Wispr Flow

Every keyboard before Acti was built to help you produce *text* — faster, cleaner, or hands-free. Acti adds the layer none of them have: it turns that text into a **completed action**. Here's where the lines fall.

	Gboard	Grammarly	Wispr Flow	Acti
Category	Predictive keyboard	Writing assistant	Voice dictation	Agentic keyboard
What you get	Faster typing	Cleaner writing	Speech → text	A completed action
Voice input	✓	—	✓	✓
Fixes & rewrites text	Basic	✓	✓	✓
Takes actions for you	—	—	—	✓
Connects to your apps & APIs	—	—	—	✓ 150+
Build your own skills, no code	—	—	—	✓

Each product is compared in its primary role — Gboard (Google) as a predictive keyboard, Grammarly as a writing assistant, Wispr Flow as voice dictation. All three are excellent at producing text; Acti is built to act on it.

09 — BEYOND ASSISTANTS

Why not just use ChatGPT or Siri?

If an AI can already answer you, why put one in the keyboard? Because answering and acting aren't the same — and **where the agent lives** changes everything. ChatGPT and Siri are places you go; Acti is already where you're typing.

YOU SWITCH TO IT

work happens in another window.

YOU CALL IT

Siri

Handy for quick voice commands, but it doesn't compose or take action inside the text field you're already in — and most real tasks fall outside what it can do.

IT'S ALREADY THERE

Acti

No app to open, no copy-paste. The agent lives inside every text field and acts right where you're typing — typed or spoken, in any app.

ChatGPT and Siri are assistants you go to. Acti is an agent that's already **where you work**.

10 — WHY NOW

Why the Agentic Keyboard is possible today

The idea isn't new because no one wanted it — it's new because it only just became possible. Two things had to be true.

Language models had to understand intent. Until recently, software could read your words but not your meaning. Modern AI can finally extract the *action* behind a sentence — the difference between recording what you typed and understanding what you want done.

And the interface was hiding in plain sight. The keyboard is the most universal surface on your phone — it appears in every app, in every text field, at the exact moment a thought becomes words. It's where intent is born. That makes it the natural home for an agent. For twenty years it sat there doing one thing. Now it can do everything.

11 — THE TEAM

Defining a new category — and winning it — takes more than a good idea. It takes people who've shipped consumer products at scale and put a keyboard on hundreds of millions of phones. Acti's founders have done exactly that.

YW

Young Wang

Founder & CEO

Spent nearly a decade at Baidu International, where he helped grow Facemoji Keyboard past 550M downloads — later [ranked #9 on a16z's Top 50 Gen AI mobile apps](#) — and co-built Yike Album, one of China's largest consumer cloud-photo products.

12 — QUESTIONS

Agentic Keyboard FAQ

What is an Agentic Keyboard?

An Agentic Keyboard is a mobile keyboard with an AI agent built into every text field — it understands what you're trying to do and completes the action from inside the keyboard. For example, it can share a location, find a link, check a price, rewrite a message, translate text, create a meeting link, or run a custom skill, all without leaving the app you're in.

What can an Agentic Keyboard do?

It can create a meeting link, draft a reply, summarize text, translate as you type, share a location, and run custom workflows — all from the keyboard, inside any app. Because it connects to 100+ apps and APIs, anything you can describe in plain language can become an action.

How is it different from an AI keyboard?

An AI keyboard improves the words you type, by fixing grammar or rewriting sentences. An Agentic Keyboard goes further and acts on your intent. The output isn't better text — it's a completed action.

How is it different from a voice keyboard?

A voice keyboard changes how words get in — you speak instead of type. An Agentic Keyboard changes what comes out — actions instead of just text. Faster input, typed or spoken, is still just typing.

No. ChatGPT and Siri are assistants you go to — you switch to an app or call them by voice. An Agentic Keyboard lives inside every text field, so it acts right where you're already typing, with no app-switching or copy-paste.

Is an Agentic Keyboard safe to use?

A well-designed Agentic Keyboard only acts when you ask it to — no silent actions, no hidden sending. You stay in control of every action, and you decide what the keyboard can access.

Where can I get an Agentic Keyboard?

Acti is the world's first Agentic Keyboard, available on iOS and Android. It introduces the Acti Bar — press to type, hold to act — and lets you build your own actions in plain language.

What was the first Agentic Keyboard?

Acti is the world's first Agentic Keyboard. Launched on iOS and Android, it introduced the category along with the Acti Bar — press to type, hold to act — and the Skill Hub for building and sharing skills.
