A PEER-TO-PEER ELECTRONIC CASH SYSTEM

Abstract. A purely peer-to-peer version of electronic cash would allow online payments to be sent directly from one party to another without going through a financial institution. Digital signatures provide part of the solution, but the main benefits are lost if a trusted third party is still required to prevent double-spending.

We propose a solution to the double-spending problem using a peer-to-peer network. The network timestamps transactions by hashing them into an ongoing chain of hash-based proof-of-work, forming a record that cannot be changed without redoing the proof-of-work. The longest chain not only serves as proof of the sequence of events witnessed, but proof that it came from the largest pool of CPU power. As long as a majority of CPU power is controlled by nodes that are not cooperating to attack the network, they'll generate the longest chain and outpace attackers. The network itself requires minimal structure. Messages are broadcast on a best effort basis, and nodes can leave and rejoin the network at will, accepting the longest proof-of-work chain as proof of what happened while they were gone.

1. Introduction

Commerce on the internet has come to rely almost exclusively on financial institutions serving as trusted third parties to process electronic payments. While the system works well enough for most transactions, it still suffers from the inherent weaknesses of the trust based model. Completely non-reversible transactions are not really possible, since financial institutions cannot avoid mediating disputes. The cost of mediation increases transaction costs, limiting the minimum practical transaction size and clogging off the possibility for small or casual transactions, and there is a inherent risk

The proof-of-work also solves the problem of determining representation in majority decision making. If the majority were based on one IP address one vote, it could be subverted by anyone able to allocate many IPs. Proof-of-work is essentially one-CPU-one-vote. The majority decision is represented by the longest chain,

Merkle branch linking the transaction to the block it's timestamped in. He can't check the transaction for himself, but by linking it to a place in the chain, he can see that a network node has accepted it, and blocks added after it further confirm the network has accepted it.

the sender can't change the transaction. We assume the sender is an attacker who wants to make the recipient believe he paid him for a while, then switch it to pay back to himself after some time has passed. The receiver will be alerted when that happens, but the sender hopes it will be too late. The receiver generates a new key pair and gives the public key to the sender shortly before signing. This prevents the sender from preparing a chain of blocks ahead of time by working on it continuously until he is lucky enough to get far enough ahead, then resending the transaction at that moment. Once the transaction is sent, the dishonest sender starts working on

Проект Накамото стал началом тихой революции. Он не только представил миру первую децентрализованную криптовалюту, но и заложил основу для смены технологической и экономической парадигмы.

Белая книга Биткоина по-прежнему является основополагающим документом — важнейшим источником информации для понимания сути биткоина, технологии блокчейн и меняющегося правового поля, в котором они существуют.

Для юридических фирм, специализирующихся на криптовалютах, таких как [Hodder Law Firm](#), анализ основных концепций White Paper крайне важен для решения уникальных проблем, связанных с децентрализованными финансами, и понимания их последствий как для бизнеса, так и для частных лиц.

Биткоин: революционное решение проблемы двойного расходования средств

Одно из самых значительных нововведений в «Белой книге» о биткоине заключается в том, как в ней решается проблема [«двойного расходования»](#). В традиционных цифровых системах посредники, такие как банки, выступают в роли доверенных третьих сторон, гарантируя, что цифровой актив не будет потрачен дважды.

Накамото предложил децентрализованное решение — блокчейн. Эта технология распределённого реестра использует сеть компьютеров для проверки и записи каждой транзакции в неизменяемом и прозрачном виде. Каков результат? Доверие формируется без централизованного контроля, что делает двойное расходование средств практически невозможным.

This breakthrough laid the cornerstone for countless other cryptocurrencies and blockchain applications.

Bitcoin: A Discovery, Not an Invention

A common debate within the crypto community is whether Bitcoin should be considered an invention or a discovery. While the concept initially seems clear-cut—Nakamoto obviously created Bitcoin—there's an argument to be made for the perspective of discovery.

The Bitcoin White Paper primarily combines and reimagines pre-existing technologies and cryptographic principles:

- **Hashcash:** A proof-of-work system designed to curb spam.
- **Merkle Trees:** A method of structuring data within blocks.

Nakamoto's genius wasn't in creating these components from scratch; it lay in their ingenious combination to solve the double-spending problem and create a robust, decentralized system. One could argue that Bitcoin's blueprint echoes that of a fundamental mathematical or scientific discovery, revealing something that was inherently possible.

This philosophical distinction has practical ramifications for lawyers in the crypto space. It adds a layer of complexity to debates about intellectual property, patents, and the way regulatory frameworks may be applied to decentralized systems that don't neatly fit into traditional models of "inventorship."

The Legal Complexities of Decentralization

The shift towards decentralization is the crux of Bitcoin's disruptive potential and the source of numerous legal complexities. The Bitcoin White Paper implicitly calls into question several key aspects of legacy financial systems:

- **Reliance on Intermediaries:** Banks and other financial institutions incur significant costs and create potential bottlenecks within transactional processes.
- **Limited Control and Censorship Resistance:** Central authorities can freeze assets, reverse transactions, or impose restrictions.
- **Privacy Concerns:** Traditional systems necessitate the sharing of sensitive personal data with trusted third parties.

With Bitcoin, transactions occur directly between peers, bypassing centralized institutions. This novel framework presents a challenge for [crypto lawyers](#) navigating issues ranging from jurisdictional ambiguity and anti-money-laundering (AML) regulations to the enforceability of contracts in a decentralized setting.

The Emergence of Smart Contracts

Although the White Paper doesn't explicitly discuss "smart contracts," the technology it introduced paved the way for their development. Smart contracts are self-executing agreements embedded as code within the blockchain. They automate transactions based on predetermined conditions, promising to streamline processes and reduce the need for intermediaries across diverse industries. For crypto law firms, understanding how these blockchain-based contracts interact with and challenge traditional legal frameworks is paramount.

A Regulatory Landscape in Flux

The Bitcoin White Paper and its promotion of decentralization spurred global debates about the role of government oversight in the cryptocurrency space. Crypto law is a rapidly developing field, with regulators continuously formulating policies to address the unique concerns presented by decentralized systems. Balancing the need for consumer protection and mitigating fraud against the desire to foster innovation is an ongoing challenge. The White Paper's principles highlight the tension between the potential benefits of decentralization and the perceived necessity of regulatory structures to safeguard market integrity.

The Enduring Impact of the Bitcoin White Paper

While the price of Bitcoin can experience volatility, the concepts enshrined in the White Paper have had a profound and lasting impact, extending far beyond the realm of digital currencies. Its influence can be observed in:

- **Finance:** The growth of alternative currencies, decentralized exchanges (DEXs), and innovative financial instruments redefines the boundaries of traditional finance.

- **Voting Systems:** The immutability and transparency of blockchains present opportunities for secure, verifiable, and tamper-proof online voting systems.
