

У технологий были странные выходные

Технологии провели длинные выходные, споря о X, как и всегда. Если вы были офлайн и вели себя как человек, позвольте мне вас догнать

Алекс Вильгельм
6 июля 2026

Добро пожаловать в «Осторожный оптимизм» — рассылку о технологиях, бизнесе и власти. С умеренным оптимизмом.

Понедельник. С возвращением. Сегодня мы поговорим о продаже вычислительных мощностей компанией Meta, недоверии к лабораториям искусственного интеллекта, ВВП и вице-президенте, а также о последних новостях из мира технологий. За работу! — **Алекс**

В тренде

- добыча нефти ОПЕК ... геополитика через призму футбола ... ElevenLabs, теперь с ARR более 500 млн долларов ... беспилотные автомобили ... увольнения в Microsoft ... Anthropic покупает еще больше вычислительных мощностей ... ИИ с открытым исходным кодом ... опасения по поводу пузыря

Тенденция к снижению

- Американские докторские степени ... Отношения между США и Италией ... мнения аналитиков о Datadog ... не использовать мем с хот-догом ... кибербезопасность

Из кулуаров технологической индустрии

В минувшие выходные технологическая индустрия, как и всегда, спорила о X. Если вы были офлайн, позвольте мне вас просветить:

Продажа вычислительных мощностей Meta: завоевание или капитуляция?

Новость о том, что [Meta намерена продать часть своих вычислительных мощностей](#) третьим сторонам, застала технологический рынок врасплох. Почему Meta, которая еще [две недели назад](#) заключала сделки по продаже вычислительных мощностей третьим сторонам, решила сдать в аренду часть недавно приобретенных графических процессоров?

Инвесторы в неочлачные сервисы, с которыми Meta заключила контракты, продали свои акции в конце прошлой недели, а CoreWeave и Nebius потеряли 19% и 23% соответственно.

Сообщения о том, что Марк Цукерберг был [не в восторге от прогресса в области искусственного интеллекта](#), заставили некоторых предположить, что недавно сформированная команда Meta по разработке ИИ работает не так хорошо, как ожидалось, из-за чего компания решила сдать в аренду часть мощностей, которые ранее зарезервировала для внутреннего использования.

Это полная чушь, [по словам главы новой команды по разработке ИИ Александра Ванга](#), который пообещал, что обновление (пока еще не выпущенной) модели Muse Spark принесет «значительные улучшения в области кодирования и агентных возможностей, что сделает ее более конкурентоспособной по сравнению с другими ведущими моделями». Скоро.

Что происходит? SpaceX - это то, что происходит. Гибрид космического центра обработки данных и искусственного интеллекта расточительно тратил средства на создание центров обработки данных для обучения и обслуживания передовых моделей, но не смог преодолеть мейнстрим искусственного интеллекта и в итоге остался без лишних мощностей. Монетизируя эти простаивающие графические процессоры, SpaceX добавила [десятки миллиардов долларов](#) быстрого (возможно, временного) дохода к своему отчету о прибылях и убытках, что должно позволить ей продолжать масштабировать капитальные вложения в различных подразделениях.

Meta, которую некоторые инвесторы [критикуют](#) за то, что она тратит как гиперскейлер, не имея бизнес-модели гиперскейлера, вероятно, хотела получить часть той же благосклонности инвесторов, которой пользуется SpaceX.

- Morgan Stanley [рассматривает этот шаг Meta](#) как способ монетизировать собственные вычислительные ресурсы для обеспечения краткосрочной прибыльности. Это вполне разумно. В контрактах SpaceXAI предусмотрен 90-дневный период отказа от услуг, так что компания может получать прибыль до тех пор, пока не захочет отказаться от услуг.

- Таким образом, Ван может продолжать обучать новые модели, пока Meta арендует свободные мощности. А позже, если новые модели Muse окажутся удачными, компания сможет при необходимости вернуть эти FLOP-серверы.

While **CO** is generally bullish on AI, we hold that [excessive cleverness usually fails](#), and the industry is at least one foot in that domain when it comes to compute deals these days. Hyperscalers and neoclouds' Q2 results will help us better understand the state of play.

AI labs: Will data concerns scare off enterprise revenue? Where will the AI industry see value accruing? Companies *serving* the global data center buildout are doing so well, the market has [rotated](#) away from hyperscalers to some degree while boosting their suppliers. Down the stack, in other words.

Where does that leave AI labs? At, or near the top of the stack. That's worrying some folks.

The concerns run as follows:

- Open-source AI will **undercut** frontier labs' pricing power. This is not a new concern, but it's grown prominent recently thanks to a steady drumbeat of [commentary from tech leaders](#) that major AI labs will see what their customers are doing with their models, and replicate that work to capture their markets.
- Palantir's Alex Karp [made that argument recently](#). He says (speaking from atop his own book) his customer base doesn't want to pay through the nose for access to Fable and GPT-5.6 (loosely) in exchange for little value while handing over their IP.
- These are not idle concerns, at least in practice. Alibaba is working to ban staff from using Anthropic's Claude models over "[security fears](#)," for example.

Naturally, the folks shouting the loudest are the very people who want to sell you the tools to train open models for your company's peculiar needs.

But there's something to the fear that using frontier models is a risk. Mercor's Brendan Foody (here's [my interview](#)) argued [recently](#) that "authorizing a foundation model to train on [your company's data] is like giving a competitor access to your Slack workspace and GitHub repository." (Here's [some more commentary](#), for flavor.)

OpenAI and Anthropic are not yet public, so it's hard to tell how they are faring. Perhaps the labs will leak new revenue numbers to assuage such concerns, but the pendulum has swung from "*leading AI models have infinite worth*" to "*AI models are not worth much*."

We've been here before. Back in [early 2024](#), Atreides Management's Gavin Baker pointed out that without unique data, no AI model would retain value. And if large companies pull

their data back from the frontier labs...

- Here's an idea: Maybe the frontier labs become pure-play cybersecurity companies!

GDP: A good economic metric? Excerpts from VPOTUS JD Vance's [recent book](#) bounced around X over the weekend, [including his notes on GDP](#), which he decries.

Now, it's worth recognizing that GDP is a flawed statistic, in that it has known limitations, and thus should be part of a balanced economic data diet. But declaring economics "fake" as a result of those shortcomings is a bit much.

The GDP truther-ism matters. The Veep [said in a recent interview](#) that he wants to move from Milton Friedman backwards: "Hamiltonian tradition is gonna be what we see in the American right and will dominate American conservative economic thinking for the future which is not laissez-faire, it's actually much more about building the kind of tools, building the kind of infrastructure that allow human beings to flourish [...] [and] if you turn economic development into a sort of idol, then you end up sacrificing a lot of the things that matter most."

- Cross that view with his jokes in the same interview about how POTUS received little pushback for the proposal of partially nationalizing AI labs, and you have a recipe for a future GOP that is protectionist in the worst possible ways.
- Such a GOP will also be regulation-forward, it's worth noting. Investor Chamath Palihapitiya recently held a fundraiser for Vance, so perhaps he'll hold his nose and allow the high priests of GDP (investors?) run the show?

The tech-right and its anti-democratic views: The public march of the technology to the right in the run-up to the last presidential election was a regular subject on **CO** (a [few examples of the genre](#) in [case](#) you [want to go back](#) in time [and read along](#)) when it was happening. Today, with most tech leaders willing to bend the knee to POTUS, it's merely the water we all swim in.

But there are indications that some tech leaders are pushing the envelope even *further*. Back in August 2025, Elon Musk [argued](#) that "common culture" is critical to national survival, and that "nobody dies to defend a ""multicultural economic zone!"

I've had a draft entitled, *"I will die for the multicultural economic zone"* that I have yet to finish in the CMS ever since. As you can surmise, I disagree with Musk's argument that diversity is bad, and the broader American experiment of limited government, free markets, and free speech are insufficient.

Musk recently endorsed a film criticized for [endorsing extra-judicial violence against grants](#). And he [came out against free speech](#) during the July 4th holiday, only to add

one more banger to his remit:

Devon Eriksen ✓
@Devon_Eriksen_

Elon, this is the moment where you're supposed to wise up and abandon classical liberalism.

If you let takers vote, they will not only take more and more, they will make it more and more rewarding to be a taker, and they will convert more and more makers into takers, forever.

Until the makers cannot carry the takers any more.

Universal suffrage leads to universal suffering.

Elon Musk ✓ ✖ @elonmusk · Jul 3

Replying to @FoxNews

Mamdani has built nothing. He is a taker, never a maker.

Here's the context: Many wealthy Americans (which Musk is, as he immigrated here [despite reportedly breaking the rules to do so](#)) are angry with the current mayor of New York City. They despise him.

The maker-taker discourse is currently popular in tech circles ([here's Friedberg](#)), as it neatly sorts society into people that the tech-right want to support (their friends) and the people they want to deport (those who disagree with them). Musk stating out loud that he thinks universal franchise is a mistake is terrifying, as it implies that the powerful want to let the takers who gets to vote; i.e., who gets to rule.

I've long believed that the the *founder-first/founder-only* viewpoint that many VCs hold today would yield political thinking that leans toward fascism. The viewpoint is that only founders matter, which is a micro-form of the great man theory. If founders are the solution to capitalism, why not also politics?

So I think it's not rare today amongst tech oligarchs to nod along with the Yarvin [viewpoint](#) that democracy is unworkable in its outcomes, and thus a different system should be tried. (A CEO, perhaps? Does anyone know of one?)

Vance's backer Peter Thiel [made a similar argument back in 2009](#), writing he no longer believed "that freedom and democracy are compatible." Thiel's argument is that people can't be trusted to vote, as they vote for things that are bad:

The 1920s were the last decade in American history during which one could be genuinely optimistic about politics. Since 1920, the vast increase in welfare beneficiaries and the extension of the franchise to women — two constituencies that are notoriously tough for libertarians — have rendered the notion of "capitalist democracy" into an oxymoron.

Not that Thiel is the first person to make this argument. Murray Rothbard [argued back in 1996](#) that women were partially to blame for the welfare state. Note how much of today's tech-right agitation against women is simply recycled thought:

Of all the Yankee activists in behalf of statist "reform," perhaps the most formidable force was the legion of Yankee women, in particular those of middle- or upper-class background, and especially spinsters whose busybody inclinations were not fettered by the responsibilities of home and hearth.

It's simply terrifying to see the world's richest man agitate for a more limited franchise while shouting that "common culture" is a national requirement, and try to stoke anti-immigrant hatred around the world. ([I am not alone](#) in this fear.)

I think the upcoming midterm election is going to prove a turning point for tech and politics. If the GOP gets its ass handed to it, as many expect (incumbent parties [often struggle](#) during midterm elections), the democracy-doubters will have fresh reason to doubt their entire process, given that their friends lost power. I doubt they will take it well.

Tech, business, and power. Modestly upbeat.
