Агент Гермеса

Версия 0.14.0

ОС Ubuntu 24.04

АГЕНТЫ ИСКУССТВЕННОГО ИНТЕЛЛЕКТА

Создание агента Hermes

Описание

Hermes Agent, the self-improving AI agent built by Nous Research, runs on your machine or server runs and lets you chat with an AI assistant through the terminal, a TUI, or messaging platforms like Telegram, Discord, Slack, WhatsApp, Signal, and email. It is designed for long-running personal automation: it can remember context across sessions, use tools, create and improve skills, run scheduled jobs, and work from a cloud VM instead of being tied to your laptop.

On this Droplet, Hermes is installed for the dedicated hermes user. Start with:

```
hermes
```

To configure or change your model provider:

```
hermes setup
hermes model
```

For DigitalOcean Gradient, use a Gradient model access key and the preconfigured endpoint <https://inference.do-ai.run/v1>. The default model in this image is minimax-m2.5.

Useful commands:

```
hermes doctor      # diagnose setup issues
hermes update      # update Hermes
hermes gateway setup # configure messaging platforms
hermes gateway start # start the messaging gateway
hermes tools       # configure available tools
```

Important paths:

```
/home/hermes/.hermes/config.yaml
/home/hermes/.hermes/.env
/home/hermes/workspace
/opt/hermes/
```

Tips:

- Run hermes doctor after setup if anything feels off.
- Use hermes model to switch providers or models later.
- Use hermes gateway setup only if you want messaging integrations.
- Keep API keys in /home/hermes/.hermes/.env, not in shell history.

Версия	3.11.15
Лицензия	Совместимый с GPL

Упаковка	OpenAI SDK
Версия	2.24.0
Лицензия	Лицензия Apache 2.0 на GitHub

Начало работы после развертывания Hermes Agent

Getting Started

Follow these steps to get your Hermes Agent instance running as a Droplet on DigitalOcean.

1. Deploy the Droplet

- Deploy the **Hermes Agent 1-Click App** from the DigitalOcean Marketplace.
- Wait for the Droplet to finish provisioning.
- The DigitalOcean dashboard may say “ready” before SSH is available. If SSH fails, wait about 60 seconds and retry.

2. Connect via SSH

```
ssh root@your-droplet-ip
```

On first login, you will see the Hermes welcome message and the setup flow may run automatically.

3. Configure Hermes

Hermes is installed for the dedicated hermes user. The first-login setup runs:

```
hermes setup
```

Use the wizard to configure:

- Model provider
- API key or auth method
- Terminal backend
- Tool settings
- Optional messaging gateway

4. Start Chatting

Run:

```
hermes
```

This starts an interactive Hermes Agent session in your terminal.

5. Verify Installation

Check Hermes health:

```
hermes doctor
```

Check template status:

```
/opt/hermes/status-hermes.sh
```

Check the configured model/provider:

```
hermes model
```

6. Configure DigitalOcean Gradient Manually

Edit:

```
nano /etc/environment
```

Set:

```
GRADIENT_KEY=your_gradient_model_access_key
GRADIENT_MODEL=minimax-m2.5
```

Apply the config:

```
sudo /opt/hermes/apply-gradient-from-env.sh
```

Support Details

Hermes writes provider secrets to:

Support URL: <https://digitalocean.com>
`/home/hermes/.hermes/.env`

Support Email: support@digitalocean.com

Hermes writes model config to:

```
/home/hermes/.hermes/config.yaml
```

More DigitalOcean Links

7. Configure Messaging Channels

[DigitalOcean Community ↗](#)

Hermes can connect to messaging platforms such as Telegram, Discord, Slack, WhatsApp, Signal, and email.

[Ask a Question ↗](#)

Start the gateway setup:

Ask anything related to system administration, programming, devops, open source, or the

```
hermes gateway start
```

Then start the gateway:

[List your solution in the DigitalOcean Marketplace ↗](#)

Partner with us to build traction for your open source project or software company.

```
hermes gateway start
```

Check status:

```
hermes gateway status
```

API Creation

In addition to creating a Droplet from the Hermes Agent 1-Click App via the control panel, you can also use the [DigitalOcean API](#).

As an example, to create a 4GB Hermes AgentDroplet in the NYC3 region, you can use the following curl command. You'll need to either save your [API access token](#) to an environment variable or substitute it into the command below.

```
curl -X POST -H 'Content-Type: application/json' \
  -H 'Authorization: Bearer '$TOKEN'' -d \
  '{"name": "choose_a_name", "region": "nyc3", "size": "s-2vcpu-4gb", "image": "herme"
  "https://api.digitalocean.com/v2/droplets"
```
