Mate Security bets a context-first AI architecture can reinvent the SOC as it lands \$35M Series A

Mate Security's Security Context Graph gives AI agents richer enterprise context as the startup raises \$35M to challenge copilot-led security operations in the SOC.

Jul 28th, 2026 11:00am by [Carly Page](#)

Every major security vendor now has an AI copilot, but **Mate Security** thinks they're solving the wrong problem.

The Tel Aviv-based startup announced on Tuesday it has raised a \$35 million Series A led by Canaan Partners, with participation from Insight Partners, Team8 and M12, Microsoft's venture fund, just eight months after closing a \$15.5 million seed round. Mate's pitch is that security operations need more than an LLM bolted onto a SOC; they need a new architectural foundation built around AI.

Cortex AI, all of which promise to help analysts investigate alerts faster. Mate, however, is betting the real differentiator isn't a smarter assistant but a richer understanding of the organization itself.

Central to that vision is what Mate calls its Security Context Graph, a continuously updated model of an organization's assets, users, business processes, and data that AI agents use to investigate alerts and make decisions with far more business context than a standalone LLM can provide.

Mate's pitch is that security operations need more than an LLM bolted onto a SIEM; they need a new architectural foundation built around AI.

Mate CEO and co-founder **Asaf Wiener** tells *The New Stack* that the company launched with that intelligence layer, but says the product has evolved significantly over the past eight months.

"We started with the intelligence layer, the context layer that we built for enterprises in order to investigate alerts and incidents," Wiener says. "We moved forward into the detection layer to connect the two, and now we're heading to the security data sources."

Mate calls the architecture Continuous Detection, Continuous Response (CDCR), linking detection and investigation so each continuously improves the other.

“We’re connecting between those two layers in the **security operations center**,” Wiener says. “With this architecture, we’re seeing amazing results related to the quality, accuracy and precision that we can get.”

Mate says the extra context helps its agents work out whether something that looks suspicious actually warrants attention. A burst of failed logins, for example, might look like an attack until the system spots that a security test was scheduled for the same time. Similarly, a large download of sensitive files takes on a different meaning if the employee involved is about to leave the company.

That approach appears to be resonating. Just eight months after its seed round, Mate has landed a \$35 million Series A, a pace Wiener says reflects customer demand more than fundraising momentum.

“The pace is really crazy. We didn’t expect that,” he said. “We saw incredible traction with our customers. We’re talking about Fortune 500 companies, and revenue growth of more than 500 percent since Q3 2025. That’s what led those VCs to come to us and want to be part of the journey.”

“We’re talking about Fortune 500 companies, and revenue growth of more than 500 percent since Q3 2025.”

“What we are seeing is more and more data sources that we need to protect. Every employee in the organization can build new applications and new data sources. We need to build more detections for those risks, and the result: We need to investigate an increasing number of alerts every day.

“With human staff alone, we cannot handle it,” he says. “We need technology to let us scale.”

That challenge isn’t unique to Mate. Every major security platform is trying to give AI more context about the environments it’s protecting, albeit in different ways. Microsoft builds Security Copilot on telemetry flowing through Defender and

Mate wants other vendors' agents to work with its Security Context Graph, rather than keeping the technology confined to its own tools. Those agents would have access to the same information about the customer and its environment. Mate says they can remember previous investigations, while a "least-agency" model restricts what each one can see and do.

While Mate is still building out that vision, Wiener said the speed at which large companies have bought into it has caught him by surprise.

"What I'm seeing right now is that we're doing those sales cycles in a few weeks," he says. "That's incredible."

He attributes that acceleration not just to security teams, but to executives pushing AI adoption from the top. "It's amazing to see that coming also from the board level, the CEO and the CIO that are pushing organizations to leverage this kind of technology."

The fresh funding will primarily go toward expanding both the product and the team, although Wiener says an AI-native company scales differently from traditional software businesses.

"The plan is to double and triple the size of the team to address the demand," he says. "But our AI builders can do much more today with the technology around us."

Mate is still competing against security giants with deeply entrenched platforms. But if its early customer growth is any indication, investors are betting that the next generation of security operations will depend less on adding another AI assistant and more on giving those assistants a deeper understanding of the businesses they're protecting.
