Сообщается, что китайская компания строит собственные машины для производства чипов DUV, и это действительно важно

Новости | Автор: Джейкоб Ридли | Опубликовано 5 часов назад

Тем временем США по-прежнему надеются запретить ASML продавать и обслуживать аналогичные машины в Китае.

Китайская компания, поддерживаемая государством, начала массовое производство установок для глубокой ультрафиолетовой литографии, сообщает **The Information**. Это большой шаг на пути к тому, чтобы полупроводниковая промышленность Китая встала на ноги.

Реклама

Для производства современного чипа требуется сложная литографическая установка, и существует два основных типа: EUV (литография в экстремальном ультрафиолетовом диапазоне) и DUV (литография в глубоком ультрафиолетовом диапазоне). Сообщается, что китайская компания освоила более старую технологию — DUV. Такие иммерсионные машины до сих пор используются для производства современных компьютерных чипов, и сегодня большинство из них производит голландская компания ASML, которая пришла на смену доминировавшим ранее японским компаниям.

Со ссылкой на источники, знакомые с ситуацией, издание The Information сообщает, что китайские машины DUV планируется **поставить заказчикам в этом году**. Среди заказчиков — Semiconductor Manufacturing International Corp., Hua Hong Semiconductor и ChangXin Memory Technologies (CXMT). Да, тот самый **CXMT, о котором все говорят** из-за растущих затрат на память.

Несмотря на то, что это создает проблемы для ASML в связи с продажами DUV-машин в Китае, считается, что эти машины уступают конкурентам по производительности и надежности.

Эта новость появилась в то время, когда **в Конгрессе США был предложен план по ограничению продаж DUV-машин в Китай**. Этот план фактически блокирует продажу и обслуживание DUV-машин в Китае. С 2019 года США уже запретили продажу EUV-машин в Китай. DUV-машины позволяют производителям чипов, чьи фабрики расположены в стране, выпускать чипы с техпроцессом до 7 нм, используя такие хитрые приемы, как мультишаблонное нанесение. Это примерно соответствует **Ryzen** серии 5000 — чертовски современный уровень. Более мелкие техпроцессы в большей степени зависят от новых EUV-машин.

The US is worried China could have a top-spec chipmaking machine despite export restrictions, but the machine maker ASML denies it

The company that makes all the West's chipmaking machines says it's selling more than it expected thanks to 'very strong momentum in both DRAM and advanced logic'

The US has approved the sale of Nvidia H200 chips to 10 Chinese firms, but sources say they're still waiting for the go-ahead from China itself

ASML's share price dropped 12%, starting July 27, when the news of this Chinese breakthrough first came out. ASML had previously stated it expects to sell roughly 130 DUV immersion machines by the year's end.

"For immersion DUV, we expect about 130 shipments this year, which is similar to the output level of these systems in 2025. This year we have worked closely together with our supply chain partners to reaccelerate our output of these systems," **said Roger Dassen, ASML CFO, in July** [pdf warning].

It expects to sell less EUV machines, around 65 Low NA systems (as opposed to High NA systems, as bought by Intel, which are more experimental). ASML wants to add capacity to make more machines in 2027, both EUV and DUV.

So, ASML might be hit by the shake-up, but moreover, it wasn't looking like it had the Chinese market all sewn up anyways, as there are controls **on DUV machines sold to China by the Dutch government**. Previous history suggests the US has lots of influence over whether it can sell its machines. Not the least bit through export controls on technology with some amount of US-originating

tech inside. Moreover, **China has been adamant in seeking out domestic production of computer chips**, and blocking the country from key technologies is likely to only spur it on more.

Though there's a long way to go for these Chinese-made DUV machines to prove their worth. **Analysts speaking to CNBC** suggest the new machines are unlikely to rock the boat too much, as they may not be up to the challenge of very modern chips or huge economics of scale. Working machines are one thing, high yields (lots of working chips on a single wafer) are another thing entirely. That might take some time, but I wouldn't bet against it happening eventually.

Best gaming laptop 2026

All our current recommendations

1. Best overall:

Razer Blade 16 (2025)

2. Best budget:

Lenovo LOQ 15 Gen 10

3. Best 14-inch:

Razer Blade 14 (2025)

4. Best mid-range:

MSI Vector 16 HX AI

5. Best high-performance:

Lenovo Legion Pro 7i Gen 10

6. Best 18-inch:

Alienware 18 Area-51
