Компания Anthropic запускает Claude Science — ИИ-платформу для научных исследований

Claude Science объединяет инструменты и базы данных, которые уже используют исследователи, превращая их в своего рода Claude Cowork для ученых.

30 июня 2026 г. в 13:00 [Фредерик Лардинуа](#)

Во вторник компания Anthropic запустила **Claude Science** — новое приложение для ученых, которое можно использовать локально на macOS и Linux или на удаленном компьютере. Anthropic описывает его как ИИ-платформу, «где ученые могут проводить свои исследования в одном месте».

В своей нынешней форме Claude Science, которая сейчас находится на стадии бета-тестирования, ориентирована в первую очередь на исследователей в области наук о жизни, но название говорит о том, что со временем компания планирует расширить сферу применения.

Introducing Claude Science (now in beta)

Доступно во всех платных тарифных планах Claude

Чтобы пользоваться этим инструментом, не нужно быть ученым. Он доступен на macOS и Linux для всех пользователей тарифных планов Claude Pro, Max, Team и Enterprise (хотя для тарифных планов Team и Enterprise его должен сначала включить администратор). Anthropic также предлагает исследовательским лабораториям тарифные планы Team со скидкой.

Anthropic отмечает, что ученым часто приходится переключаться между многочисленными базами данных и инструментами, такими как PubMed, Jupyter, R и терминал. Цель Claude Science — объединить все это, подключив передовые модели Anthropic к базам данных, платформам и инструментам, которые уже используют исследователи.

Фото: Anthropic

Как и в большинстве областей, научные исследования включают в себя много повторяющейся работы, которая на самом деле не способствует развитию науки. Инструмент, о котором пишет Anthropic в своем анонсе, призван помочь «исследователям анализировать литературу и проводить многоэтапные исследования. Он ориентирован на артефакты и позволяет пользователям итеративно дорабатывать рисунки и рукописи, пока они не будут готовы к публикации. Каждый результат сопровождается историей его создания, что позволяет ученым проверять и воспроизводить результаты».

Not a new model

Anthropic stresses that it isn't launching a new model for Claude Science. Instead, it is backed by the standard Claude models. When users work with the tool, they first interact with a generalist coordination agent that has access to over 60 databases and a set of relevant skills. The tools also support any other service that they can connect to over MCP.

TRENDING STORIES

1. OpenClaw and Hermes agree on what an agent is. They disagree on what controls it.
2. AWS launches a desktop for agents

4. Developers are now validating code they didn't write — and may not understand
5. The US government just told OpenAI who's allowed to use the next GPT 5.6 model

Anthropic is actually using the skills from Nvidia's new **BioNeMo Agent Toolkit** to connect to life sciences models and libraries, including Evo 2, Boltz-2, and OpenFold3.

"The specialized science stays with the partners who built it."

It's worth noting that OpenAI is also **integrating** the BioNeMo Agent Toolkit.

The screenshot displays the Claude Science interface, which is divided into three main sections:

- Left Panel (Navigation):** Includes a sidebar with options like "scRNA-seq", "New", "Customize", "Files", and "Active". The "Active" section shows "SCVI Hyperparameter S..." with a count of 8.
- Center Panel (SCVI Hyperparameter Screen):** Displays a table of hyperparameters for an 8-arm sweep. The table has columns for "arm", "n_latent", "n_layers", and "label". Below the table, there is a t-SNE plot showing cell clusters, with a legend on the right. A "REMOTE" section lists various lab clusters and their corresponding parameters.
- Right Panel (Notebook):** Shows a Python notebook titled "liver-pipeline" with code for data processing and analysis. The code includes imports for pandas, numpy, and scanpy, and uses the SCVI library for model training and evaluation. The output of the code is displayed below the code cells.

As Anthropic also notes, Claude Science is meant to be the reasoning layer and connective tissue. "The specialized science stays with the partners who built it," the company explains.

the agent about any detail, annotating figures and manuscripts in-line so the agent knows what to address to make them publication-ready,” Anthropic explains.

The code for these visualizations is always available, as is the full message history of their creation.

Connecting to HPC and Modal

Since Claude can’t exactly run large genomics pipelines or protein folding jobs itself, the tools can also interact with existing high-performance computing clusters via SSH or a **Modal** account. This, Anthropic argues, ensures that the researchers don’t have to waste time on writing those jobs and troubleshooting them. Instead, Claude will draft a plan, the researchers will review it, and Claude will then submit it to the lab’s existing resources.

An agent then keeps an eye on the job and its outputs, flagging any issues. It’s also possible to fork the session at any point to try different approaches.

The competition

Large language models do lend themselves to a service like Claude Science, and Google, OpenAI, and others are pushing in the same direction.

At its I/O conference in May, for example, Google launched “Gemini for Science,” which it also explicitly **pitched** as “a scientific workbench on your desktop,” bundling science skills across 30-plus life-science databases and its “AI co-scientist” hypothesis engine. Google’s DeepMind, of course, also has a long history in using AI for life sciences research — and a Nobel prize to show for it.

OpenAI also made science and early focus with services like **Prism**, its tools for scientific writing, and **GPT-Rosalind**, a frontier model specifically built to accelerate scientific research and drug discovery. With the departure of **Kevin Weil** in April of this year, though, OpenAI disbanded its OpenAI for Science and sunset Prism as it shifted its focus towards more of its core services (and Codex).

of Kubernetes to the advent of quantum computing....
