Программа SCORPION: глубокая трансформация французской армии

АВТОР DEFENSE INNOVATION REVIEW

16 АПРЕЛЯ 2026 ГОДА

301 ПРОСМОТР

Грифон и ягуар — DGA

Программа SCORPION — это масштабная стратегическая инициатива, направленная на модернизацию французской армии.

Программа, запущенная в начале 2010-х годов, не ограничивается заменой устаревших транспортных средств. Она представляет собой глубокую трансформацию методов ведения боевых действий, интеграцию передовых технологий и улучшение координации между различными подразделениями.

Цели программы и лежащая в ее основе философия

Программа SCORPION является частью долгосрочных усилий по модернизации.

Ее цель — заменить несколько поколений машин, предназначенных для выполнения различных задач. Вместо того чтобы сосредоточить все функции в одной бронированной машине, Франция выбрала архитектуру, основанную на нескольких взаимодополняющих платформах. Такой подход позволяет специализировать машины для выполнения конкретных задач, сохраняя при этом общую согласованность.

Эта постепенная трансформация отражается в поэтапной интеграции нового оборудования, сопровождающейся изменениями в методах эксплуатации, обучения и логистической поддержки. Эффективность машин SCORPION зависит не только от их индивидуальных характеристик, но и от того, насколько хорошо они интегрированы в более широкую систему.

Три основных боевых машины: Griffon, Jaguar и Serval

В основе программы лежат три основные боевые машины, каждая из которых предназначена для выполнения определенных задач в наземных боевых действиях:

- **GRIFFON:** Он составляет основу вооруженных сил, обеспечивая защищенный транспорт для войск. На его долю приходится большая часть работ по обновлению флота, и он значительно

повышает уровень защиты и мобильности развернутых подразделений.

Французский армейский «Грифон» VBMR – Argus

- JAGUAR: Эта машина предназначена для разведки и ведения боевых действий, она обладает более высокой огневой мощностью и усовершенствованными датчиками. Она играет ключевую роль в поддержке подразделений, а также в обнаружении и нейтрализации угроз на расстоянии.

«Ягуар» французской армии 6×6 — Европейская безопасность и оборона

- **SERVAL:** It completes the force structure with a lighter, more mobile platform. It is designed for a wide range of missions, especially in environments where rapid deployment and flexibility are critical.

A French Serval VBMR-L – *Calibre Defence*

The real value of the program lies in the complementarity of these vehicles. None of them is designed to do everything, but together they provide a coherent response across a broader operational spectrum.

Operational changes and concrete benefits

The gradual introduction of SCORPION vehicles is changing the way units are deployed and employed. Crew protection has improved, while mobility and coordination have been enhanced. However, these gains are not automatic. They depend on vehicle availability, crew training levels, and the ability of the support system to keep pace with deployment requirements.

Recent exercises and industrial communications have highlighted the importance of fleet coherence. That coherence provides a real advantage, but it also requires continuous adaptation to evolving threats and lessons learned from the field.

Program challenges and limitations

Like any program of this scale, SCORPION faces significant constraints:

- Delivery pace: The program's ramp-up depends on industrial capacity, which determines the pace of deliveries.
- Logistics support: Budgetary resources influence timelines and priorities, which can lead to adjustments or delays. Maintenance and technical availability are critical factors.
- Adaptation to threats: The program must constantly adapt to evolving threats and feedback from operational units.
- Dependence on connectivity:

The system's effectiveness relies on the reliability of communications and information systems.

Current status and future outlook (2025–2026)

In 2025–2026, the SCORPION program has entered a ramp-up phase in which vehicle deliveries are continuing and the transformation of units is already visible. However, this transformation remains gradual, with newer vehicles still coexisting alongside older ones.

The most structurally important dimension of the program lies in its ability to connect vehicles to one another through the Scorpion combat information system. This system makes it possible to share the tactical picture, unit positions, and combat data in real time.

SCORPION is no longer seen solely as a transformation program for the French Army. It is also beginning to emerge as a structuring offering at the European level. After Belgium, and then Luxembourg through the CaMo partnership, other countries are now taking a close look at French armored vehicles. Cyprus is among the most advanced cases, with reported interest in Griffon and Serval vehicles

as part of a gradual effort to replace Russian-origin equipment and deepen its strategic ties with Paris.

Ireland also appears to be among the countries that could join this dynamic

, with discussions reportedly involving the acquisition of Jaguar, Serval, and Griffon vehicles to modernize its armored force. This development gives the program a new dimension: SCORPION is no longer just a national modernization effort, but also a driver of interoperability, industrial influence, and military cooperation in Europe.

The SCORPION program is an ambitious and complex effort that is deeply transforming the French Army. It is an ongoing transformation whose results will depend as much on time as on the ability to sustain and adapt the broader system over the long term. The challenges are significant, but the potential gains in protection, mobility, and coordination are substantial.

By overcoming these obstacles, France will significantly strengthen its army's ability to meet tomorrow's security challenges and maintain a lasting tactical advantage. SCORPION is therefore an essential strategic investment.
