

## AI and Robotics

# Viral video shows Qualcomm-powered humanoid robot collapsing during live keynote

The company blamed a communication glitch, saying the incident will help improve the robot's software and reliability.

Qualcomm said the incident will improve system reliability and help develop safer, more resilient robots.

Qualcomm

An AI-powered humanoid robot unexpectedly collapsed on stage while walking out to co-present a keynote, drawing widespread attention online.

The robot, powered by Qualcomm's Dragonwing IQ10 AI platform, fell face-first moments after reaching the stage during a live demonstration at Computex 2026 in Taiwan.

It briefly raised a fist but could not stand back up, prompting handlers to rush in, cover it with a cloth, and carry it away. The incident, reportedly caused by a communication glitch, has since gone viral on social media.

Last year, Russia's first AI-powered humanoid robot, named AI<sup>2</sup>dol, made an embarrassing [debut](#) after collapsing face-first on stage during a live demonstration at a major technology forum.

## **Humanoid robot takes a tumble**

The Qualcomm-powered humanoid robot's unexpected collapse during a live demonstration at Computex 2026 in Taiwan created an awkward moment on stage and quickly became a viral topic on social media.

Video from the event shows the humanoid carefully walking across the stage alongside a presenter before suddenly pitching forward and landing face-first with a loud thud. Despite the fall, the robot briefly raised one of its fists,

appearing to signal that it was still operational. However, it was unable to stand back up on its own.

As the audience watched, several members of the demonstration team rushed onto the stage to assist. The handlers covered the robot with a small satin cloth before carefully lifting it and carrying it off the stage, bringing the live demonstration to an abrupt end.

Following the incident, Qualcomm said the robot's fall was caused by a communication glitch during the demonstration. The company noted that live technology demonstrations always involve a degree of risk and emphasized that the failure would provide valuable real-world data to improve the robot's software and overall system reliability for future demonstrations.

In a statement, Qualcomm said the [robot](#) executed its built-in safe-collapse sequence, lowering itself to its knees to help protect people and its surroundings. The company added that the safety systems functioned as

designed and that the incident provided valuable real-world data to improve system reliability and accelerate the development of safer, more resilient robots, reports [Creative Bloq](#).

## **Humanoid AI engine**

Qualcomm's Dragonwing IQ10 Robotics Reference Design (RRD) is a production-ready platform intended to help robotics developers move more quickly from prototype to commercial deployment. The integrated system combines compute, sensing, networking, real-time control, and software into a single architecture for industrial robots, autonomous mobile robots (AMRs), and humanoids.

Built around Qualcomm's Dragonwing IQ10 processor, the platform acts as the robot's central brain, delivering up to 700 TOPS of AI computing power for tasks such as recognizing objects, planning movements, and making decisions in real time. It includes 18 CPU cores, dedicated AI processors, and a graphics processor, while supporting up to 12 cameras, plus LiDAR, Time-of-Flight sensors, and motion sensors. This allows robots to better see, understand, and navigate their surroundings while simplifying system design and improving response speed.

According to Qualcomm, the platform is designed to help robots move accurately and respond reliably by supporting fast, stable connections between sensors, motors, and other components. Built for harsh environments, it can operate in temperatures ranging from -40°C to 70°C (-40°F to 158°F) and works

with both 12-volt and 24-volt power systems commonly used in industrial machines and robots.

On the software side, the Dragonwing IQ10 RRD includes ROS 2 support, on-device AI runtimes, platform services, and cloud-based lifecycle management through Qualcomm AI Hub. Qualcomm said the platform is backed by ecosystem partners including NEURA Robotics, Advantech, APLUX, Booster, Innodisk, MeiG, NEXCOM, Radxa, Thundercomm, and VinMotion, which are exploring deployments across next-generation robotics applications.
