Anthropic предоставляет @Claude постоянное место в ваших каналах Slack

Claude Tag позволяет корпоративным командам использовать в Slack многопользовательский искусственный интеллект, который работает под собственным именем.

Компания Anthropic **объявила о выпуске Claude Tag**, нового продукта, который встраивается непосредственно в Slack в качестве постоянного общего участника команды. Он накапливает институциональные знания, работает асинхронно и может действовать без дополнительных указаний.

Продукт, доступный в бета-версии для клиентов с тарифными планами Enterprise и Team, заменяет существующее приложение Claude от Anthropic в Slack, которое **дебютировало в октябре 2025 года**. Эта первоначальная интеграция позволяла пользователям отправлять личные сообщения Claude, вызывать его через панель с ИИ-помощником или отмечать его в

помощью которого разработчики могли отметить Claude в разговоре, и он запускал полноценную сессию программирования в веб-версии, а по завершении отправлял в обсуждение запрос на слияние.

В этом смысле Claude Tag делает для Slack примерно то же, что Cowork сделал для работников умственного труда: он берет агентский цикл, зародившийся в Claude Code, и адаптирует его для новой платформы и более широкого спектра задач, а не ограничивает его инженерными процессами.

Во многих отношениях Claude Tag — это следующий шаг в развитии технологии: теперь Claude не просто присоединяется к разговору по запросу, а затем замолкает, а постоянно находится в канале. Задачи можно планировать на несколько часов или дней, и Claude будет выполнять их самостоятельно, накапливая контекст, изучая терминологию и подхватывая незавершенные темы, которые в противном случае остались бы без внимания.

Этот контекст не обязательно ограничивается одним каналом: если администраторы предоставят доступ, Claude сможет использовать информацию из других каналов для выполнения поставленной задачи.

Клод Тег в действии

ВСТВО ИДЕНТИЧНОСТИ

подключенного инструмента, он публикует сообщения в Slack от имени приложения Claude, открывает пул-реквесты от имени собственного приложения на GitHub и запрашивает данные из хранилища под учетной записью службы, созданной администратором. Если включено «автоматическое» поведение, Claude вообще не нужно помечать тегами — он отслеживает обсуждения, отмечает то, что, по его мнению, должно быть в поле зрения команды, и следит за неактивными ветками, как в режиме «авто», уже знакомом пользователям Claude Code.

Beyond scoping tool and data access, administrators can also set a ceiling on how many tokens each channel's Claude is allowed to spend; it's a guardrail against an autonomous agent running up costs while working unattended.

There's one Claude per channel, shared by everyone in it, so any team member can see what's being worked on and pick up where a colleague left off. That multiplayer dynamic is arguably one of the most significant departures from how AI assistants have hitherto worked.

For instance, a task tagged to @Claude by one person can be steered, corrected, built upon by the rest of the team in real time.

Multiplayer steering in action

Underpinning all of this is what Anthropic calls “agent identity” — the access construct that makes multiplayer AI possible without creating a security mess. **Noah Zweben**, a member of technical staff on the Claude Code team, **notes in a companion blog post** that this model is a necessary foundation for the kind of autonomous, team-wide work Claude Tag is designed to handle.

“The shift from single player to multiplayer AI in products like Claude Tag makes long-running, team-based work possible.”

“The shift from single player to multiplayer AI in products like Claude Tag makes long-running, team-based work possible,” Zweben writes. “Agent identity ensures that Claude’s access to tools is broad enough to be useful, but scoped enough to be secure at enterprise scale.”

In terms of how this works, Zweben explains why the traditional model — where an AI assistant borrows the permissions of whoever invoked it — needed to be rethought. Agents now schedule tasks and respond to events long after the person who asked has logged off, and in a shared channel with multiple people steering, there’s no single user whose credentials make sense to inherit.

stead, administrators define what Claude can access at the workspace level, with each channel inheriting a baseline set of permissions that can be tightened or

“Agent identity replaces the question ‘what can this user do?’ with ‘what can this agent do in this compartment?’”

An engineering channel might get read and write access to GitHub and the data warehouse; a general channel might get read-only. Crucially, because Claude operates under its own accounts rather than anyone’s personal credentials, a shared channel can never serve as a backdoor into someone’s private documents.

“Agent identity replaces the question ‘what can this user do?’ with ‘what can this agent do in this compartment?’” Zweben writes.

Race for the Slack layer

Team messaging platforms are fast becoming the primary control layer for AI agents in the enterprise — the place where work gets assigned, monitored, and reported back on. GitHub has **brought Copilot into Microsoft Teams**, for instance, where OpenAI’s **Codex includes** a native Slack integration that lets teams delegate tasks directly from threads. And Cognition’s **Devin has been built around Slack** from the get-go.

Block, the Jack Dorsey-led company behind Square and Cash App, **has also spent some time building something akin to this from scratch**, using its open-source Goose framework to develop an agent orchestration system its engineers manage entirely from a single Slack thread.

Whichever AI ends up as the default presence in the channel where work is coordinated gains both a distribution advantage and a compounding data advantage, making it progressively harder to displace. For a company already running Claude Code in its engineering org, adding Claude Tag to its Slack channels is a natural next step — and one that deepens that dependency considerably.
