Stop Using `useEffect` for Everything: 7 React Patterns That Make Your Code Simpler

I used to think `useEffect` was the answer to almost everything in React.

Need to fetch data?

`useEffect` .

Need to update something when a prop changes?

`useEffect` .

Need to calculate something?

`useEffect` .

Need to sync two pieces of state?

Probably another `useEffect` .

Then one day I opened a component I had written a few months earlier.

It had four `useEffect` s, three pieces of derived state, two loading flags, and one bug nobody could explain.

The component worked.

Until it didn't.
