

Новая эра Midjourney

Сегодня мы расскажем о чем-то немного странном и немного безумном, но в то же время впечатляющем и полном надежд.

Это не имеет отношения ни к чему из того, что вы видели от нас до сих пор. Однако мы, люди, стоящие на передовой, чувствуем себя обязанными обратиться к истокам человеческого опыта и задаться вопросами: «Чем мы хотим отличаться от других?», «Как мы хотим отличаться от других?» и «Кем мы хотим стать?».

Мы должны задавать эти вопросы. Мы должны находить новые ответы. И мы должны рассказывать истории о человеческом будущем, частью которого мы все хотели бы стать.

Поэтому мы объявляем:

MEDJOURNEY MEDICAL

Мы создаем принципиально новый тип машин, чтобы переосмыслить основы здравоохранения и наше отношение к собственному телу.

Мы мечтали о чем-то столь же мощном, как магнитно-резонансная томография, и столь же доступном, как поход в спа-салон, и сегодня мы открываем путь к этой мечте.

Одной из главных тем XXI века станет расширение возможностей искусственного интеллекта и то, как мы их используем. Мы каждый день общаемся с искусственным интеллектом и все чаще обсуждаем с ним вопросы нашего здоровья.

Независимо от того, обращаемся ли мы к врачам или к искусственному интеллекту, наше отношение к здоровью зависит от наличия данных и понимания того, как работает наш организм.

Вам нужно как можно быстрее и дешевле получить как можно больше данных о своем здоровье. Другими словами, вам нужна технология, оптимизированная для получения максимального количества информации о вашем организме в пересчете на «мегабайты в секунду на доллар».

В идеальном и ближайшем будущем мы будем собирать эту информацию и следить за тем, как она меняется с течением времени. Мы будем сравнивать ее с данными о населении в целом, консультироваться с врачами, диетологами, коучами, тренерами и друзьями-ИИ. Мы будем больше заботиться о своем здоровье и улучшим свой образ жизни. Мы будем принимать более взвешенные, проактивные и частые решения. И мы будем жить дольше, здоровее и лучше.

Вот она, мечта. А теперь вернемся к нашей *машине*:

Сканер Midjourney

Сначала вы входите в неглубокий бассейн, наполненный золотистым светом. Затем начинаете погружаться в воду. Ваше тело проходит через кольцо подводных датчиков, каждый из которых работает по принципу эхолокации дельфинов. Датчики посылают ультразвуковые звуковые волны, которые проходят через ваше тело со всех сторон. При достаточном количестве волн

и ракурсов мы получаем изображение того, что происходит внутри вашего тела.

Цель состоит в том, чтобы этот процесс занимал не более 60 секунд.

Заходишь в воду, выходишь из воды — и готово.

Looking Closer

TECHNICAL VIDEO

When you step into the water, you're standing on top of a platform. The platform is connected to rails and begins to descend into the water - an elevator gently lowering you at around 2 inches, or 5 centimeters, per second.

As you descend you pass through a ring made of half a million tiny squares each the size of a fine grain of sand, and each capable of acting as both a tiny speaker and a tiny microphone.

Each square creates ultrasonic waves and records the ripples back at millions of times per second. Together they act as both a choir and an audience - producing terabytes of data each second. If we converted that data into HD internet video you'd need to watch 500 hours of footage for every 1 second of scan data.

The sheer number of mechanical elements, the inconceivable volume of data, and the computational power required for this to all come together is one reason why no such machine was ever made - until now.

As you descend into the water, hundreds of thousands of tiny elements take turns, sending out waves, listening together, compressing and then streaming data to a massive cluster where thousands of computers split the task.

The major computational task is figuring out how to change waves into images. Basically - as waves travel through the water and your body they change shape. The shape of these waves changes whenever there is a change in density or stiffness (i.e., going from water to skin to fat to muscle to bone). By looking at how the shapes of all the waves change, we reconstruct a detailed map or 'image' which basically lets us figure out what's in there.

Each slice continuously crossfades between the raw reconstruction and its AI segmentation - what the scan lets us identify inside the body. Use < / > to browse examples.

All of these images come together to cover a 3D map of your body, down to a fraction of a millimeter, that looks a lot like today's MRIs but at nearly a hundred times the speed.

A reconstructed body volume, swept slice by slice – the torso and the legs. Use < / > to switch.

Finding its Form

We think this kind of medical imaging could become not just commonplace, but a casual, everyday, literally “whenever you want” kind of thing. It's just sound waves, a bath of water, and 60 seconds.

So the next question is how do we integrate something like this into our daily lives?

We want to use the nature of this warm and gentle water to build an experience that isn't even necessarily about health, but is just a nice place to go, someplace you'd want to be even if there was no scanner.

So that's why we're building our scanners alongside another new product:

The Midjourney Spa

The first Spa will be opening in the heart of San Francisco in 2027.

Our spa will have hot tubs, saunas, cold plunges, and cozy rooms with pools of golden light which softly scan your body.

Concept renders of the Midjourney Spa.

It should be a place you love going, whether it's by yourself, or with friends. It should be available 24/7. The scans are a side-effect. You barely think of them when going to the spa. But suddenly, you have a huge library of data about your health.

The Roadmap From Here

The next 12 months are about refining our algorithms and hardware on a daily basis. We'll be doing research trials to show off the raw capabilities of our system, moving towards a 2nd generation hardware design, and we'll do build-out for our first "research spa" which will become the promethean site that enables mass-scale health scanning.

Around the end of 2027 we'll open up the Spa, and we'll begin getting real world knowledge of what this infrastructure is going to be like.

This is moving at the maximum speed that's physically possible. We want to advance the fundamental technology as fast as we can and get used to operating it at scale. Beyond that, regulation is the next limit. Normally, for every diagnostic medical capability you need FDA approval. We're starting by just giving you detailed body composition maps – and we'll be submitting regular test results to the FDA for increased capabilities.

In 2028 we'll start scaling to more cities and we'll upgrade to a 3rd generation scanner. Gen3 is where it gets 'serious,' the silicon for this design will be completely custom and image quality and scan times will be night-and-day.

Our ambitious goal is by 2031 to have a fleet of over 50,000 scanners worldwide - with a total scanning capacity of a billion scans a month - enough to cover a huge percentage of the global population, or enough to give regular, monthly scans to a billion people.

What This Leads To

Whether or not our scanners are a service that everyone uses, to us, the most important thing is that everyone *will* be able to use them. That, collectively, we can begin to change our relationship with our bodies and start to ask questions like: if we can catch things early, can we change our lifestyles to correct them? And seeing our bodies change over time, alongside our actions, how much can we improve our health, our minds, and our lives?

We think it's completely possible that with enough early imaging in the future, the world could avoid 30% of all deaths and 50% of all healthcare costs. The cultural, physical, and mental health benefits of all of this are hard to comprehend, but also hard to overstate.

A New Kind of Research Lab

As a reminder, Midjourney has no investors. We are a totally new kind of research lab. We've seen academic, corporate, and government labs - but we are a distinct (and curious) new thing: we are a community-backed research lab.

We're funded by everyday people, and because of this, we are also starting a new community around this project as well.

We want your thoughts on what you are most excited to see from our scanners. We want your thoughts on what our spas should be like.

But really, we just want you to be involved. A technology like this is intended for everyone, and we need your help to make sure it turns out that way.

So with that, we invite you to join us.

We'll be publishing regular updates, exciting new scan images, and concepts of the spa as we design and build it out. We want to ask you lots of questions too! Your support and opinions help us be confident in our speed and scale and that we'll make something in the first pass that everyone will love.

We hope with this announcement you start to see that Midjourney is a research lab that's constantly asking what we can build for people, and what we can change within the foundations of the human experience.

Beyond this, we have even more exciting projects that we've been working on for the past few years, and we can't wait to show you more from here.

We hope today you can feel a little more that **we are all Midjourney.**
