SanDisk снизились на 11%, Seagate - на 7%, Micron снизился на 4% за счет предложения памяти - опасения перенасыщения

Автор **Дэвид Моадель**,

опубликовано 2 июля, 12:02 EDT

Краткое чтение

- ✓ Акции SanDisk упали на 11%, Seagate - на 7%, а Micron - на 4%, что привело к непрерывным убыткам, поскольку сектор памяти продемонстрировал невероятную прибыль в 2026 году.
- ✓ Bank of America повысил целевую стоимость акций SanDisk до 2500 долларов и присвоил им рекомендацию «покупать», что прямо противоречит предупреждению Morningstar о грядущем падении на 20–30 %.
- ✓ Компания Micron сообщила о росте выручки на 346 % по сравнению с прошлым годом, прогнозирует выручку в четвертом квартале на уровне 50 миллиардов долларов и торгуется всего с 7-кратным дисконтом к будущей прибыли, несмотря на сегодняшнее падение стоимости акций.
- ✓ **Действуйте прямо сейчас:** аналитик, который в 2010 году назвал NVIDIA перспективной компанией, только что составил свой список из 10 лучших акций в сфере искусственного интеллекта — и Micron Technology в него не вошла. [Получите список бесплатно уже сегодня.](#)

Акции компаний, производящих память и накопители, снова падают в цене в четверг утром, продолжив редкий откат для отрасли, которая демонстрировала значительный рост до 2026 года. **Акции SanDisk** ([NASDAQ:SNDK](#) | [Прогноз цены SNDK](#)) лидируют в падении, снизившись на 11% до 1802 долларов на дневных торгах. **Акции Seagate Technology** ([NASDAQ:STX](#)) упали на 7% до 852 долларов, **Western Digital** ([NASDAQ:WDC](#)) — на 7% до 556 долларов, а **Micron Technology** ([NASDAQ:MU](#)) — на 4% до 992 долларов.

Отраслевой индекс движется синхронно. **ETF на акции компаний памяти** ([CBOE:DRAM](#)) упал на 5% до 62 долларов, что отражает общую слабость акций компаний, производящих NAND-память, DRAM и жесткие диски, поскольку трейдеры сокращают вложения в одни из самых прибыльных компаний 2026 года.

В четверг акции Micron и SanDisk также резко упали. Ситуация выглядит как фиксация прибыли и институциональная ребалансировка в начале второй половины года без явного фундаментального триггера, вызванная новым предупреждением от известного исследовательского центра.

Morningstar Warning Fuels the Reset

The immediate catalyst is commentary from Morningstar's director of research, Lorraine Tan, who told Bloomberg TV that a large slice of AI names could give back 20% to 30% before becoming buyable again. As we detailed recently, Tan [flagged the biggest-gaining memory names](#) as the most exposed to a valuation reset.

Her concern centers on capacity. Announced supply additions from Samsung and SK Hynix are expected to soften memory pricing as supply catches up with demand, while AI capital expenditure is expected to peak in 2026 and taper thereafter. That combination targets exactly the pricing power that drove the group's dramatic margin expansion this cycle, and it lands on stocks that have posted enormous multi-hundred-percent gains in 2026.

The Roundhill Memory ETF illustrates the concentration risk. Its top holdings include Samsung Electronics at 25%, SK hynix at 24%, and Micron at 24%, followed by SanDisk, Western Digital, and Seagate. When capacity fears hit, the whole basket moves.

Bull Case Isn't Going Quietly

The sell-side counterpoint remains firm. **Bank of America** ([NYSE:BAC](#)) on Wednesday raised its SanDisk stock price target to \$2,500 from \$2,100 with a Buy rating, arguing the NAND supply-and-demand imbalance and firm pricing should persist through 2027. That target sits well above where SanDisk stock is trading after today's slide.

Act now: the analyst who called NVIDIA in 2010 just named his top 10 AI stocks — and Micron Technology didn't make the cut. [Grab the names FREE today.](#)

Micron's fundamentals also cut against the glut narrative. The company reported fiscal Q3 revenue of \$41.46 billion, up 346% year over year and guided fiscal Q4 revenue to \$50 billion, citing multi-year Strategic Customer Agreements as cycle insulation. Micron stock trades at a forward P/E ratio of 7x, with a consensus analyst target of \$1,410 and overwhelmingly bullish coverage.

Seagate and Western Digital carry similar tailwinds. Both are seeing accelerating hard-disk demand tied to AI training and inference storage, and both delivered solid earnings beats in their most recent quarters. Retail sentiment, notably on Reddit, has stayed largely bullish through the pullback, though sentiment is not a fundamental.

What to Watch Now

The Roundhill Memory ETF offers a clean read on how the group trades from here, though the ETF and its underlying chip stocks have been highly volatile. A one- or two-day pullback after such a run doesn't by itself invalidate the long-term thesis, but it does test conviction at a very different price than a month ago.

The tension is easy to identify here. The bull case rests on AI-driven memory demand outpacing supply into 2027. The bear case, articulated by Morningstar, is that new capacity plus a plateau in AI capex could compress pricing sooner than expected. Both can be right on different timelines, which is why position sizing matters.

Investors may want to size their positions in these names carefully after an extraordinary run. Market watchers can watch for whether the group finds a bid into the close, and whether any Wall Street desk pushes back publicly on the Morningstar call in coming sessions.
