

АГЕНТЫ ИИ / ИНФРАСТРУКТУРА ИИ / БЕЗОПАСНОСТЬ

Почему инструменты на основе искусственного интеллекта ничего не знают о вашей компании — до сих пор

Cloudflare запускает CloudflareOS — рабочее пространство с искусственным интеллектом и открытым исходным кодом, которое предоставляет сотрудникам безопасный доступ к корпоративным системам, приложениям и инструментам агентов без утечки ключей API.

6 августа 2026 года, 15:30 [Адриан Бриджуотер](#)

Пунит Мишра

На этой неделе компания Cloudflare запустила платформу CloudflareOS с открытым исходным кодом для рабочих пространств с искусственным интеллектом, пообещав каждому сотруднику безопасное рабочее пространство с инструментами на основе ИИ и доступом к внутренним системам компании.

гораздо более динамичный способ работы с внутренними корпоративными инструментами, документами и системами, чем устаревшие

экран, и даже динамическая доставка приложений, **маскировка приложений** и потоковая передача в современных версиях VDI.

CloudflareOS от Cloudflare обеспечивает доступ к своим приложениям и сервисам через **безопасные точки подключения**, которые проверяют каждого пользователя и каждый агентский запрос или точку подключения перед предоставлением доступа.

В сфере искусственного интеллекта каждая новая рабочая сессия начинается с нуля

Предлагаемая технология основана на фундаментальной истине: типичный корпоративный ИИ-инструмент знает многое об окружающем мире, но почти ничего не знает о том, как работает конкретная компания, о структуре ее внутренних систем, процессах согласования и о том, как команды на самом деле выполняют свою работу.

Это означает, что каждая новая рабочая сессия начинается с нуля, и сотрудникам приходится заново объяснять контекст, который ИИ уже должен знать. Но как обеспечить безопасность новых агентных свобод доступа с учетом бизнес-контекста?

Рита Кослов, вице-президент Cloudflare по работе с разработчиками и искусственным интеллектом, рассказывает *The New Stack*, что современные сценарии использования агентов означают, что «данные часто массово покидают контролируемые системы» — впервые в истории.

«Раньше, например, люди задавали аналитические вопросы в **хранилище данных**, где организация имела полный контроль, — говорит Кослов. — Теперь сотрудники запрашивают API-ключи для своих собственных инструментов, агентов и т. д. Это создает новый класс проблем с безопасностью, которые помогает решить Cloudflare OS».

Доступ на основе возможностей лучше, чем передача агентам необработанных ключей API

Cloudflare разработала то, что мы можем назвать доступом на основе возможностей, который, по обещаниям компании, лучше, чем прямая передача агентам необработанных ключей API.

«API-ключи дают агентам широкий доступ к системам. Подход на основе предоставления доступа к возможностям позволяет нам предоставить доступ к одному конкретному ресурсу, а затем фиксировать именно то, что наблюдал агент, и проверять, что любой, кто видит его работу, также имеет доступ к исходному коду», — подчеркивает Кослов.

Cloudflare OS enables an agent to create documents, slides, spreadsheets, workflows, other agents – or entirely new full-stack applications – all tailored to an employee’s work. What it creates can remain connected to live data sources, be modified and shared safely, and be used directly by both people and agents.

“API keys give agents broad access to systems; a capability-access-based approach lets us grant one specific resource, record exactly what the agent observed, and verify that anyone who sees its work is also allowed to access the source.”

In terms of how developers and systems operations professionals should react to this offering, Koslov suggests that “the difficult problem is not generating an app” today. Instead, the real challenge is safely running thousands (or millions) of dynamically generated apps, each with persisted state and controlled access.

“Cloudflare OS uses **Dynamic Workers**, which provide lightweight isolated runtimes to load each app’s code on demand, and **Durable Objects Facets** to give it isolated state storage under the platform’s supervision. Outbound networking is disabled

because doing this was previously not possible.

For completeness here – and once again a Cloudflare original technology service – **a Gatekeeper is a service-specific Worker** that sits between Cloudflare OS and an external service to interpret and understand the service’s API, its resources, and the operations that can be performed on them.

What happens when it all goes wrong

Koslov confirms that she knows how badly things can skew out of control in unmanaged environments.

“We know this from our own experience talking to other companies on all accounts. They’ve shared instances of internal data copied into AI tools that IT did not know were in use, AI keys embedded into agent-built applications, and even data being shared internally to people who ordinarily wouldn’t have access (or even publicly),” she adds.

Building a tailored alternative is no small project; a platform with proper security and real integration into internal systems can take years to develop and cost millions to maintain. In the meantime, employees find workarounds, IT loses track of which AI tools are running and who is using them, and costs pile up, often with little to show for it.

CloudflareOS starts from a different premise: a company captures its knowledge, processes, and ways of working once in a form AI can actually execute, and that knowledge travels with every employee’s workspace from day one.

How do we measure business ‘context’?

“Captured business ‘context’ in this case can include company terminology, policies, operating procedures, product documentation, technical standards, sales processes, templates, and established ways of performing recurring work,” confirms Koslov.

CloudflareOS started as the platform Cloudflare built to run its own workforce. Thousands of Cloudflare employees across every team use it daily to perform research, create documents connected to live data, automate repetitive tasks, and build working apps for their day-to-day jobs.

organizations own what they build on it.

The platform itself works on any AI model and controls cost. Through Cloudflare AI Gateway, organizations can use any AI model provider, so they're not locked into one vendor. Administrators see exactly what's being spent, broken down by person, team, or app. They can set spending budgets, rate limits, or route routine tasks to smaller, more affordable models where a top-tier model isn't needed.

Pricing platforms by the token is the wrong meter entirely

Cautiously upbeat about the wider story playing out here, enterprise AI architect and founder of **Besk Tech**, **Vladimir Beskorovainyi**, tells *The New Stack* that, traditionally, the industry is pricing these platforms by the token, "and that is the wrong meter entirely" in his view.

"In this example with Cloudflare OS, what a company actually buys here is the obligation to write down how an AI-powered business process really works, and then keep that description true as the business shifts underneath it," Beskorovainyi says. "The model is the commodity part. What costs real money is the curated context, and nobody budgets for the fact that it starts decaying the day it is written, which is exactly what decides whether any of this survives contact with production."

"Cost broken down by person, team and app is the first time I have seen a vendor treat spend as an engineering signal rather than an invoice, and sending routine work to a smaller model is the obvious next step that most enterprises still fail to take."

Beskorovainyi insists that the organizations that win in this game will "not necessarily be the ones running the best model"; they will be the ones that could "already answer in writing what their own approval process is", way before an agent ever asked.

"Cost broken down by person, team and app is the first time I have seen a vendor
treat spend as an engineering signal rather than an invoice, and sending routine

Owning your own context is not the same as your context being any good

He clarifies his point and explains that the qualification here is that “owning your own context is not the same thing as your context being any good”, and so open source tooling and community connections plus an organization’s own account settle who holds the context file.

“Neither tells us whether what is recorded and logged in the context file is still true this quarter. That work stays with the customer permanently, and it is where I expect most of these deployments to come apart, not in anything Cloudflare has built,” Beskorovainyi adds.

Matthew Prince, co-founder and CEO of Cloudflare has said that his team built Cloudflare OS, “because nothing else did what we needed”, and so now, any company can start from where it took the organization’s internal software engineering function years to get to.

The apparent appeal here must come down to the dynamic nature of Cloudflare OS and its ability to work with and apply AI tools at a custom-engineered business context-aware level with zero trust by default. The platform can turn any output into a working app with its own isolated database, real-time capabilities, and access controls – once again, that’s not legacy virtual desktop is it?

No developer required (yet)

The bottom line from Cloudflare is that employees can use any app on Cloudflare OS directly, or adapt it for their own needs so that it’s a case of “no developer required”, or at least until the next integration task needs to be shouldered, or the big thing comes along, or both.
