7 Ways Developers Accidentally Expose Sensitive Data

Most data leaks do not begin with an attacker breaking encryption. They begin when an application sends, stores, logs, or shares more information than the current operation requires.

7 Ways Developers Accidentally Expose Sensitive Data

Sensitive data is rarely exposed because a developer intentionally publishes it. The exposure usually enters the system through code that appears useful.

An API returns the complete user object so future frontend work will not require another backend change. A logger captures the full request because an incident is difficult to reproduce. A download link contains a file identifier so it can be shared easily. An analytics event includes the form values developers want to study later. A temporary export is unloaded to cloud storage and scheduled for deletion after the
