30 нетривиальных способов использования GPT-4 для разработчиков

Обзор того, как разработчики используют GPT-4 от OpenAI для программирования, а также советы ChatGPT от The New Stack.

1 июня 2023 года, 9:39 [Лорейн Лоусон](#)

Признаюсь: я редко пользуюсь ChatGPT. Мне не нравится, что он выдает ложные факты. Если мне приходится проверять все, что он говорит, какой в этом смысл? Тем не менее я использовал его для планирования огорода, что, признаю, довольно банальное применение.

недавнем [посте на Hacker News](#) разработчики поделились своими способами использования большой языковой модели. Мы собрали здесь лучшие предложения, а также рекомендации самого ChatGPT о том, как его следует использовать разработчикам.

1. SQL-запросы

Один из комментаторов пишет, что плохо справляется с написанием SQL-запросов с большим количеством объединений. Поэтому программист просто показал боту определения таблиц и сказал, что ему нужно. Как это часто бывает с искусственным интеллектом, может потребоваться несколько попыток, чтобы все получилось, предупредил комментатор.

2. Написание регулярных выражений

Тот же комментатор использует ChatGPT-4 для написания регулярных выражений. «Он отлично с ними справляется», — сообщил программист.

3. Прототипы

Другой разработчик использует его для мозговых штурмов и создания прототипов подходов к решению проблемы. В частности, он использовал его в основном для пайплайнов машинного обучения, небольших [React](#) сайтов и [Python](#) интерфейсов командной строки (CLI).

«Сначала я попрошу его дать мне обзор проблемной области; это дает [LLM контекст](#)», — заявил он. «Затем я описываю проблему и прошу его предложить решения, а также плюсы и минусы каждого подхода. Это итеративный процесс: вы можете задавать ему вопросы, корректировать его предложения и периодически подводить итоги. После этого вы можете либо попросить его предоставить код для прототипа, либо создать его самостоятельно».

4. Rubberducking

[Rubberducking](#) — это практика отладки кода с помощью объяснения проблемы на устном или письменном естественном языке. Термин появился благодаря истории из книги «Программист-прагматик», в которой программист носит с собой резиновую утку и отлаживает свой код, заставляя ее объяснять его утку, строчку за строчкой. По словам одного

5. Personal Tutoring

While ChatGPT-4 “is not there yet” when it comes to pure development or peer review, said one user, it is good at clarifying follow-up questions as a virtual tutor.

6. Coding a Database

Along with 7. finding a bug in the metrics, 8. speeding up the test cycle, 9. reducing pressure on the garbage collector and tightening some timer handling, and 10. finding unnecessary type assertions.

Developer Philip O'Toole used ChatGPT-4 for #6-10 and more. It saved him so much time and he enjoyed it so much, he wrote a [blog post about how it helped him code](#) the database. At one point, he wasn't sure how ChatGPT-4's suggested changes would help reduce pressure on the garbage collector so he asked it to explain, which it could. [He made the changes.](#)

11. Writing Micro-Benchmarks for C++

“They always compile, but require some editing,” noted [Simon Boehm](#). It also requires good prompting, Boehm added.

12. Explaining Assembly Code

13. Optimizing Code to Reduce Memory Usage

"I had to optimize some Python code to reduce its memory usage," wrote **Vitor Baptista**. "After trying all ideas I could think of, I thought about rewriting it in a different language. Copied and pasted the code into ChatGPT 4. Tried **Rust** at first, but there were too many compilation errors. Then I tried **Go** and it worked perfectly." The developer had never used Go and used ChatGPT-4 to improve the Go code. It gave me great answers, I think maybe once or twice the code didn't compile (I used it dozens of times per day)," Baptista wrote. "I'm now using the optimized Go code in production."

14. Writing in JavaScript (or Any Language That Isn't Your Strength)

Another programmer uses it to generate code in languages that are not that well known to the programmer, which in this case was **JavaScript**. "My JavaScript isn't the strongest, so I'd prolly have to spend 30-45 minutes just coming up to speed again on my basic AJAX and modern syntax, or BAM write a schema of my idea and get GPT to get my idea on paper with halfway decent style, syntax," the programmer stated. "I can take it from there."

15. Looking up How to Do Something

"GPT-4 is bad at doing things and great at looking things up for you," read one submission. "Rather than trying to get it to do things, I ask it how I should do it."

16. Frontend Writing

One developer used GPT-4 to write a simple React app to test out an endpoint. Once the code was working, the developer put the app back into the AI and asked it to make it "more visually appealing" — and it did.

17. Testing and Documentation

One of the big predictions with AI is that it will be customized for testing. One person is already using it to do unit testing and some documentation. "I find that the code it spits out isn't perfect but getting some boilerplate and fixing it up is pretty fast compared to writing from scratch," the person stated. "I've used this enough that I wrapped some cli glue around it..." Mostly the commentator has used

20. OpenSearch (or Elasticsearch) Query Building

"I was new to the technology and their syntax took a while to wrap my head around. Instead I'd just tell ChatGPT my document format and then ask for specific data in natural language," wrote one poster. "Fair warning, the queries were not always perfect on first try, but it was a lot easier than parsing replies to somewhat similar questions on [Stack Overflow](#). Now I mostly write my own queries but it really helped me get started."

21. Getting the Ball Rolling in General

The code may not be perfect, but a number of developers said they use GPT-4 to "get the ball rolling" on coding problems. One used it to get started with TypeScript and React. Essentially, the AI acts as a scaffold for learning how to do something complex. One tip for that: Iteratively ask the bot to summarize everything that's agreed upon before asking it to write the code, suggested another programmer.

22. Image Processing

One programmer reported using GPT-4 to do image processing in OpenCV. "It's saved a lot of time I would've spent figuring out the required transforms and matrix operations," the developer wrote.

23. Shell Scripting

It's great for any type of shell scripting and works well for fleshing out type definitions, according to one hacker news reader. Another developer reported using ChatGPT-4 to produce a working web socket server in Rust when the developer had no experience with the networking crate for async runtimes.

Inspired by these ideas, The New Stack decided to ask ChatGPT-4 itself how developers can best use it for building applications. Here's what it suggested:

24. Natural Language Processing

"Integrate me into your application to provide natural language understanding and generation capabilities," the AI told The New Stack. "I can assist with tasks like language translation, sentiment analysis, text completion and summarization."

25. Developing a Chatbot

or instructions.

26. Generating Content

“If your application requires generating content such as articles, product descriptions, or social media posts, you can utilize my language generation abilities to create coherent and contextually appropriate text,” the bot suggested and indeed, one developer on Hacker News did report using the AI to develop wiki articles pages for an encyclopedia in development.

27. Researching and Knowledge Assistance

This one seems most self-evident but is non-trivial. It can also be used to summarize dense passages developers may find in their research.

28. Integrating a Virtual Assistant

“Incorporate me into **virtual assistant** applications to provide intelligent and context-aware responses,” the AI suggested. “I can help users with tasks like scheduling, reminders, recommendations, and general information retrieval.”

29. Following Best Practices for Code Generation and Debugging

This may seem repetitive, but it’s worth pointing out that the chatbot can also provide insights into programming concepts and best practices.

30. Simulating End User Interactions

“Employ me to simulate user interactions and test the functionality of your application,” the AI suggested. “You can generate sample inputs, evaluate outputs, and perform scenario-based testing.”
