За пределами VPN: Cloudflare Mesh создает частную сеть для эпохи ИИ-агентов

Cloudflare Mesh дебютирует для защиты «клиентов нового класса». Узнайте, как частная сетевая инфраструктура объединяет мультиоблачную инфраструктуру для агентов ИИ, кода и людей.

компания Cloudflare решила устранить этот недостаток, запустив Cloudflare Mesh — сервис частных сетей, предназначенный для объединения мультиоблачных сред в единую защищенную структуру для людей, агентов и кода.

В надежде создать новую точку соединения для облачных подключений между людьми, агентами и кодом **Cloudflare стремится к этому**. Компания Cloudflare, предоставляющая услуги примерно для 20% пользователей интернета, во вторник анонсировала одноименный сервис Cloudflare Mesh — частную сетевую службу, призванную объединить **мультиоблачные инфраструктуры** в единую защищенную сеть.

Частная сеть: определение

Чтобы понять, что такое Mesh, нужно сначала разобраться в специфике «частной сети» от Cloudflare. В отличие от традиционного частного облака, эта модель подключает внутренние ресурсы, включая серверы, базы данных и среды разработки, к глобальной сети без открытия портов в брандмауэре компании.

«По мере распространения автономных агентов компаниям придется пересмотреть модели доступа, иначе они рискуют столкнуться с небезопасными обходными путями для «нового класса клиентов», которым нужен защищенный доступ к внутренним ресурсам», — Кристиан Рейли, Cloudflare.

По сути, Cloudflare Mesh помогает разработчикам программного обеспечения и операционным командам шифровать каждую точку подключения, не раскрывая внутреннюю инфраструктуру и данные в общедоступном интернете.

Компания утверждает, что появление агентов промышленного уровня является основным подтверждением работоспособности ее технологии. Поскольку агентам ИИ требуется полный доступ к базам данных частных компаний, внутренним API и «**промежуточным средам**» (предварительно развернутым экземплярам приложений, наборам данных или сервисам, к

Опасные туннели, устаревшие соединения

В своей роли технического директора по региону Европы, Ближнего Востока и Африки в Cloudflare **Кристиан Рейли** рассказывает *The New Stack*, что предоставление такого агентского доступа с помощью устаревших VPN или **туннелей, созданных вручную** — медленный и по своей сути рискованный процесс.

He underlines the fact that, today, many teams are forced to choose between stifling their agents with restricted access or potentially exposing their private infrastructure to the public Internet to make them functional.

“As autonomous agents become more common, businesses must rethink access models or risk insecure workarounds for the ‘new class of client’ that needs secure access to internal resources,” Reilly says. “This means organizations must rethink access models or risk insecure workarounds. Cloudflare Mesh addresses this by ensuring each agent has a verified identity and routes all traffic through our global network, delivering consistent performance across regions and clouds without fallback to the public internet.”

Because every packet passes through Cloudflare’s security stack, Reilly insists that identity and security are built in by design, not added as a separate layer.

that AI agents experience in modern developer workflows. He says that they are being “throttled by a networking model” that was designed strictly for humans. Faced with the choice of a **complex and clunky VPN**, or taking the dangerous shortcut of exposing private infrastructure to the open web, Prince claims Cloudflare Mesh removes that trade-off.

“We are providing a secure bridge between agents and infrastructure – whether those agents are running on Cloudflare, in a private datacenter, or in another public cloud,” Prince says.

An identity for every agent

Orbiting between the three celestial realms of connectivity, security and identity management, Cloudflare Mesh is positioned as a foundation for agent identity. In a Mesh environment, every agent – just like every human employee – carries a distinct identity.

This presence of identity allows security teams to write granular policies: for example, allowing a coding agent or sandbox to read a staging database while strictly preventing it from accessing live production financial records with sensitive company data, personally identifiable information, or both.

By integrating Cloudflare Mesh with the Cloudflare Developer Platform, including the organization’s Workers product (a serverless edge computing code service), Workers VPC (for virtual private clouds), and its Agents SDK, Cloudflare says it offers an end-to-end lifecycle for AI agents.

A walled garden for work

Cloudflare Mesh promises to eliminate the complexity of cross-cloud networking, allowing developers to bridge laptops, office hardware and multi-cloud environments (AWS, GCP) into a single private fabric.

The company says that its technology enables teams to create a cohesive network that is entirely walled off from the public internet. By routing private IPs through Cloudflare’s global network, sensitive data (from cloud infrastructure to distributed devices and AI tools) remains encrypted and invisible to external threats.

scoped access to private APIs and databases through what the company dubs as simple code commands.

With the global land grab for agentic AI creation and control still playing out, there now appears to be a commensurate level of platform and tool development designed to lock down (or at least control and manage at a more granular level) agentic actions throughout the modern stack.
