

Альманах

Almanax — Инженер по безопасности с ИСКУССТВЕННЫМ ИНТЕЛЛЕКТОМ

Продукт для обеспечения безопасности приложений на основе
искусственного интеллекта, который понимает код, бизнес-логику
и инфраструктуру так же хорошо, как человек-эксперт по
безопасности.

Начало работы

Просканировано более 100 миллионов
строк кода

Вот как это работает

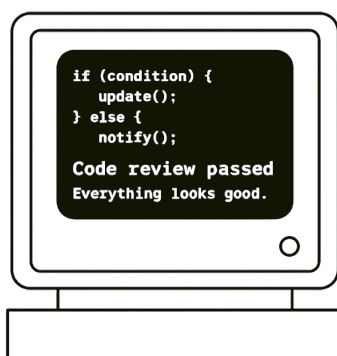

ШАГ 01

установить приложение Almanax Github

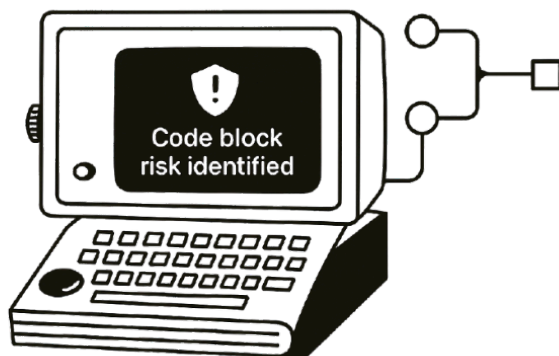

ШАГ 02

Запустите ручное сканирование

Выявление существующих уязвимостей в кодовой базе любого типа

ШАГ 03

Непрерывные проверки кода

Проверяйте каждый пул-реквест и блокируйте потенциально опасный код до его слияния с основной веткой

WHAT WE OFFER

High Intelligence AI Detection

State-of-the-art LLMs, combined with comprehensive context understanding, detect complex security vulnerabilities in your codebase.

- Codebase indexing and navigation
- Internet access for real-time threat intelligence
- Access to your custom documentation
- Ecosystem-specialized models (EVM, Solana, Stellar, Aptos, and more)

Critical Unbounded GZip Decompression in Paraphraser

DESCRIPTION

The Paraphraser class loads an entire gzip-compressed...

IMPACTED CODE

```
open_fn = gzip.open if str(paraphrase_source).lower().endswith('.gz') else
open
with open_fn(paraphrase_source, 'rb') as f: # type: ignore
    self.paraphrase_source = json.loads(f.read())
```

CONTEXTS USED

audiocraft/data/audio_dataset.py #L42–64

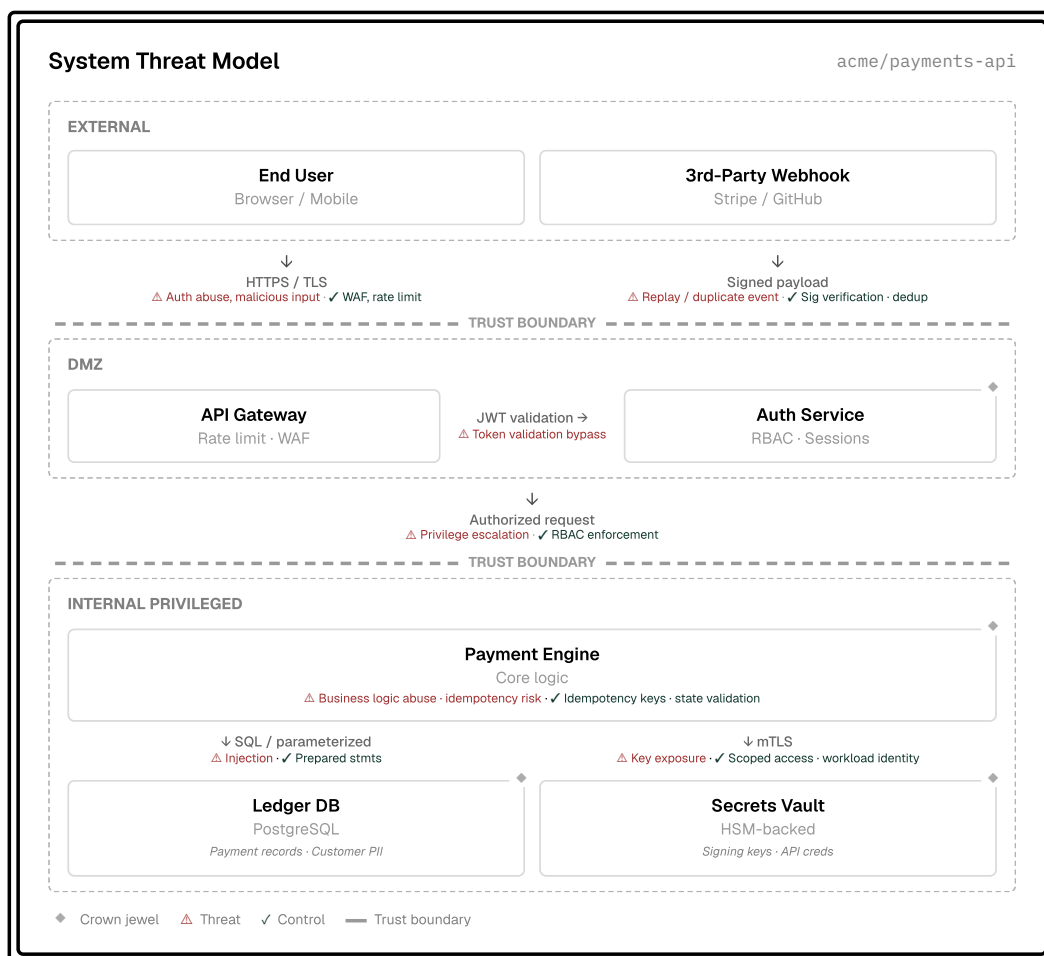

audiocraft/data/audio_dataset.py #L128–232

audiocraft/data/audio_dataset.py #L255–256

Almanax maps your system architecture, identifies trust boundaries, and generates threat models automatically — so your team stays ahead of threats, not behind them.

- Automatic attack surface mapping from code structure
- Trust boundary identification across services
- STRIDE-based threat classification
- Continuously updated as your code evolves

Agents that learn from your team

Our agents build project-specific long-term memory from every developer interaction — dismissed findings, review feedback, and code patterns unique to your codebase. Over time, they become smarter about what matters to your team.

- Learns from dismissed findings to reduce false positives
- Remembers codebase-specific patterns and conventions
- Adapts to your team's risk tolerance and priorities
- Project-scoped memory — isolated per repository

Agent Memory Log

acme/payments-api

LEARNED FROM DEVELOPER INTERACTIONS

- ✓ Dismissed finding · Reentrancy via External Hooks
Memorized: PoolManager.sol uses reentrancy guards — suppress in future scans
- ✓ Review feedback · Hardcoded config values
Memorized: Config in constants.ts is intentional — not flagged as hardcoded secrets
- ✓ Pattern from 14 reviews · Arithmetic safety preference
Memorized: Team prefers SafeMath wrappers over unchecked blocks for arithmetic
- ✓ Dismissed finding · Floating-point precision in fee calc

3rd-Party Alert Triaging

Performs reachability analysis of third-party alerts and triages their validity so you focus only on actionable security issues.

AI Review

FINAL DECISION

False Positive

EXPLANATION

The vulnerable function `strip_tags()` and the associated template filter `striptags` are never used in the application code or templates. A search for both the function and filter yields no references, and no data flows invoke HTML stripping at runtime. Since the application does not expose this code path, the DoS vulnerability in Django's HTML stripping is not reachable in production.

REACHABILITY ANALYSIS

- Verified that Django 5.1.6 (vulnerable range) is installed via `Pipfile.lock`.
- Searched the `django_ledger` codebase for any invocation of `strip_tags()`; found no matches.
- Searched for the `striptags` template filter in all template files; found no usage.
- Confirmed there are no imports or references to `django.utils.html.strip_tags` in Python modules or management commands.
- Reviewed templates directory and application views to ensure no implicit calls to HTML stripping functions.

MITIGATION

No immediate action required. Continue to monitor for future direct uses of `strip_tags` or the `striptags` filter. If HTML content must be stripped in the future, upgrade Django to `>=5.1.9` to eliminate the vulnerability before invoking the function.

Automatic Patching

Committable patch suggestions and PR drafts are automatically provided for detected vulnerabilities.

High Severity Vulnerability

Альманах

parameter, e.g., supplying `query=\"%' OR 1=1;-- \"` could expose or manipulate all applications.

RECOMMENDATION

Use Django ORM filtering with parameterized queries, e.g.:

```
SimpleApplication.objects.filter(user=request.user,  
                                company_name__icontains=query)
```

SUGGESTED CHANGE

```
- def get_queryset(self):  
-     query = self.request.GET.get('q')  
-     if query:  
-         return SimpleApplication.objects.raw(  
-             "SELECT * FROM job_applications_simpleapplication WHERE  
company_name LIKE '%" + query + "%'"  
-         )  
-     return
```

Built for Enterprises

Enterprise-grade security and compliance features designed for scale

CI/CD Integration

No AI training on your data

Deployment on your infrastructure

Альманах

Support for most programming languages

Your code is analyzed in a sandbox environment, then deleted

What people have to say

"Results were very good! Much better than the previous automated audit we did. Will be implementing most/all of the recommendations ahead of our next contract deployment. Some pretty big issues that we need to address around the Aave integration."
