

Sugar High

Super lightweight syntax highlighter

```
/* super tiny syntax highlighter */  
import { highlight } from 'sugar-high'  
const code = highlight('const text = 1')
```

light.css

dark.css

light.css

dark.css

```

/* light.css */
:root {
  --sh-class: #8d85ff;
  --sh-identifier: #354150;
  --sh-sign: #8996a3;
  --sh-string: #00a99a;
  --sh-keyword: #f47067;
  --sh-comment: #a19595;
  --sh-jsxliterals: #bf7db6;
  --sh-entity: #6eafad;
  --sh-property: #4e8fdf;
}

```

```

/* dark.css */
:root[data-theme='dark'] {
  --sh-class: #7eb5ff;
  --sh-identifier: #d4d4d4;
  --sh-sign: #8b949e;
  --sh-string: #88bbb6;
  --sh-keyword: #ffada8;
  --sh-comment: #8b8b8b;
  --sh-jsxliterals: #d2a8ff;
  --sh-entity: #56d4dd;
  --sh-property: #79c0ff;
}

```

Themes

Set token colors with scoped CSS variables, then use cx for emphasis. Explore the copyable [CSS and Tailwind theme guide](#).

Line highlighting

Each line is a `.sh__line`, so target lines with CSS selectors or a custom line class.

line-highlight.css

```

.sh__line:nth-child(5),
.sh__line--highlighted {
  background: #fff8c5;
}

```

Languages

JavaScript works by default. Pass canonical names directly. `lang()` turns aliases and extensions such as `py` and `yml` into `python` and `yaml`.

presets.js

```
import { highlight } from 'sugar-high'
import { lang } from 'sugar-high/lang'

highlight('const ready = true') // JavaScript is the default
highlight('print("hi")', { lang: 'python' }) // canonical name
highlight('name: sugar-high', { lang: lang('yaml') }) // yaml →
yaml
```

Code block & editor

Use the `<Editor />` & `<Code />` to present or edit highlighted code.

```
1 export default function App() {
2   return (
3     <>
4     <h1 id="title">
5       Hello
6       <span> world</span>
7     </h1>
8     <div style={styles.bar} />
9   </>
10 )
11 }
12
13
```
