

ИНФРАСТРУКТУРА ИСКУССТВЕННОГО ИНТЕЛЛЕКТА / ЭКОСИСТЕМА CLOUD NATIVE / НАБЛЮДАЕМОСТЬ / ОТКРЫТЫЙ ИСХОДНЫЙ КОД

Став стандартом телеметрии для облачных вычислений, OpenTelemetry вступает в эру инфраструктуры искусственного интеллекта

Платформа с открытым исходным кодом для мониторинга, которая лежит в основе современного облачного ПО, разрабатывалась 7 лет и наконец получила официальное признание.

Cloud Native Computing Foundation (CNCF) в четверг объявила о выпуске OpenTelemetry, платформы с открытым исходным кодом для мониторинга,

Эта веха знаменует собой завершение семилетнего пути проекта, который **начался в 2019 году** как объединение двух конкурирующих инициатив в области наблюдаемости: **OpenTracing**, стандарта распределённой трассировки, поддерживаемого Cloud Native Computing Foundation, и **OpenCensus**, проекта телеметрии, изначально запущенного Google и поддерживаемого такими компаниями, как Microsoft.

Сегодня OpenTelemetry широко используется для сбора и экспорта телеметрических данных — трассировок, метрик и журналов — через распределённые программные системы. Выпуск представляет собой наивысший уровень зрелости CNCF для проектов с открытым исходным кодом, свидетельствующий о стабильности управления, внедрении в производство и долгосрочной устойчивости. Фонд заявил, что OpenTelemetry в настоящее время является одним из “высокоскоростных” проектов в экосистеме CNCF, уступая только Kubernetes, с более чем 12 000 вкладчиками и участием более 2000 компаний.

Для многих разработчиков и команд, занимающихся инфраструктурой, OpenTelemetry уже много лет является базовой инфраструктурой, поэтому ее формальный выпуск на рынок кажется несколько запоздалым. **Крис Анищик**, технический директор Cloud Native Computing Foundation, рассказывает *The New Stack*, что процесс выпуска проектов на рынок намеренно затягивается, чтобы они могли стать долгосрочными отраслевыми стандартами.

«Цель сертификации — дать предприятиям уверенность в том, что они опираются на нейтральную и надежную основу».

“Our graduation process isn’t meant to be fast; it usually takes a multi-year effort of building stability, security, and resilient governance to ensure long-term, sustainable innovation for the entire industry,” Aniszczyk says. “For a project as critical as OpenTelemetry, we need to confirm it is a permanent, vendor-neutral component of the modern stack and not reliant on any single commercial interest. The goal of graduation is to provide enterprises with the certainty that they are building on a neutral and solid backbone.”

can realistically manage. As cloud environments sprawl across public infrastructure, private data centers, Kubernetes clusters, and — increasingly — AI-generated services, observability teams are grappling with rising complexity and **mounting data costs**. OpenTelemetry's vendor-neutral positioning helped drive broad industry adoption — major cloud providers and observability vendors including Microsoft Azure, AWS, Google Cloud, Datadog, Grafana Labs, Splunk, and New Relic now support it in various forms.

Historically, those vendors often relied on proprietary agents, SDKs, and telemetry pipelines that made it difficult for organizations to move between platforms. OpenTelemetry helped standardize instrumentation across programming languages and infrastructure environments, allowing telemetry data to flow more easily between monitoring and analytics systems.

Aniszczyk suggests the 2019 merger between OpenTracing and OpenCensus helped prevent fragmentation across the observability market, while also changing how vendors compete commercially by weakening proprietary telemetry lock-in.

"Before OpenTelemetry, vendors competed on proprietary agents/collectors and data formats, which often led to customer lock-in."

is fierce on the next layer: developer and user experience on top of delivering high signal insights, superior AI-driven analysis and cost effective solutions.”

Speaking to *The New Stack* in early 2026, **Tom Wilkie**, CTO at Grafana Labs, also **argued that** OpenTelemetry had helped erode traditional observability lock-in by standardizing instrumentation across platforms.

“Teams no longer have to piece together vendor-specific SDKs, and new observability players can enter the market more easily because instrumentation is no longer the moat,” Wilkie said.

Yet OpenTelemetry’s rapid growth has also introduced operational headaches for some adopters. In a **2025 proposal** outlining future stabilization efforts, the project’s Governance Committee acknowledged that OpenTelemetry’s “complexity and lack of stability” had created “impediments to production deployments,” citing issues including breaking configuration changes, performance regressions at large deployments, and the difficulty of coordinating upgrades across hundreds or thousands of services.

In an interview with *The New Stack* in December 2025, **Ari Zilka**, founder of observability startup MyDecisive.ai, **said some enterprises** had effectively turned OpenTelemetry into “a team sport,” with large organizations dedicating entire internal teams to managing telemetry infrastructure and collector deployments.

Those concerns reflect broader frustrations that have lingered across the observability market for years. Organizations operating large distributed systems often collect enormous quantities of logs, traces, and metrics, generating hefty monitoring bills in the process.

OpenTelemetry doesn’t solve observability economics on its own, of course, but its standardization efforts have helped lower barriers for **newer observability vendors** attempting to compete with established platforms.

Infrastructure pressure

The project’s graduation arrives as AI-generated software and autonomous infrastructure systems begin placing additional pressure on observability tooling. Coding systems can generate services, deployments, API calls, and infrastructure changes far faster than traditional software development cycles.

for monitoring and coordinating those systems.

“The shift to AI agents and autonomous systems is the single most important evolutionary pressure on infrastructure today.”

“The shift to AI agents and autonomous systems is the single most important evolutionary pressure on infrastructure today,” he says. “We view OpenTelemetry as moving beyond a traditional observability framework — it’s now becoming foundational for AI workloads and models. This means scaling to entirely new orders of magnitude, where telemetry is the constant sensory input for AI agents.”

The CNCF says growing AI workloads are helping drive increased OpenTelemetry adoption across the ecosystem. According to **npm download data**, the project’s JavaScript API package grew from roughly 75 million monthly downloads in April 2025 to more than 200 million monthly downloads by April 2026, marking a record month. The project’s **Python API package** also hit record download levels over the same period.

Juraci Paixão Kröhling, co-founder at observability startup **OllyGarden**, says many organizations are discovering that AI systems introduce the same operational and reliability problems long associated with distributed cloud infrastructure.

“As organizations rush to put AI workloads into production, they are discovering that GenAI systems are distributed systems, with all the latency, reliability and cost questions that come with them,” Kröhling said in a statement. “OpenTelemetry gives those teams a common language to instrument agents, models and the services around them without locking into any single vendor.”
